A FEW MATCHES

in the pocket of a coat, a busy rodent and a conflagration. How often this story has been chronicled—but it never occurred, nor could it occur, when clothes are kept in

DENNISTEEL FACTORY LOCKERS

The wooden cupboard and the nail in the wall are frequent breeders of disease. A germ-laden garment carries its danger no further than its isolated steel cabinet. Fire and sickness reduce profits—to take every possible precaution against them is practical economy. To ask for our Catalogue is the first step in this direction.

The Dennis Wire & Iron Works Co. Limited
LONDON, CANADA

More Holes Per Dollar of Cost

That is the real test of Drill efficiency. *Wilt Twist Drills* will give you more holes per hour—
More hours of service before wearing out.
And every hole will be absolutely accurate and uniform.

Wilt Twist Drills are made by a new automatic process that machines the drill complete at a single chucking — work that requires 5 to 7 chuckings under old processes.
The Wilt process insures absolute accuracy and uniformity, it insures a drill that is perfect in contour and correct in its proportions.
Wilt Drills are hardened in automatically controlled electric furnaces to exactly the right degree of hardness for the work intended.
Try a Wilt Drill on your hardest job.

The YOST

Solid Jaw and Swivel Bottom Machinist's Vise

MADE IN CANADA.

A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satisfaction. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

Incomparably Good

The National catalog would certainly interest you. Write us, asking for a copy.

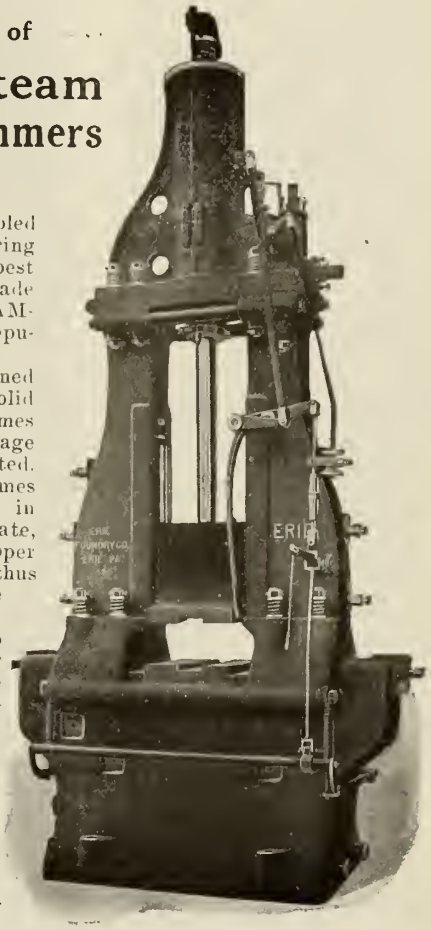
National Machinery & Supply Co., Ltd.

HAMILTON - - ONTARIO

This Guarantee Goes With Every Vise: We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

The construction of

"Erie" Steam Drop Hammers



is different.

That difference, coupled with sound engineering ability and the very best of materials, has made for "ERIE" HAMMERS an enviable reputation.

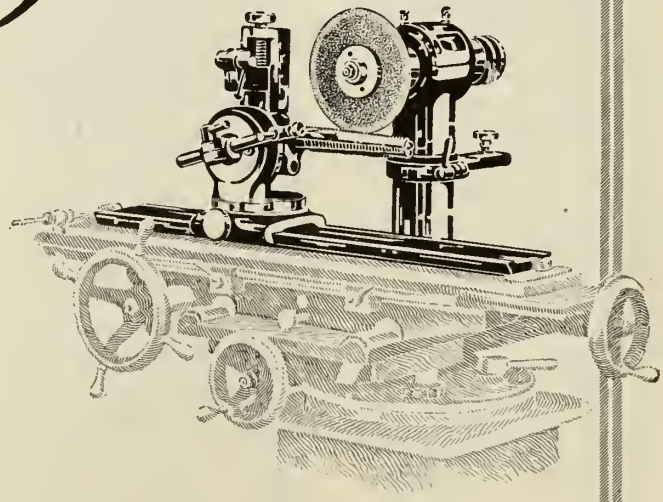
The Guides are designed so that they have a solid backing in the Frames the full length. Breakage is positively eliminated.

The Cylinder and Frames are securely held in place by a steel tie plate, making the entire upper works as a unit, thus assuring accurate forgings.

Would you like to know other strong points of the "ERIE" construction? Send for catalogs.

Erie Foundry Company

Erie, Pennsylvania



Do You Consider the Life of Your Tools?

When you grind tools with properly selected

Norton Alundum Grinding Wheels

you will obtain a cutting edge that will show the longest life. A wheel that will not burn, check nor "skin soften" the tool must be of a special temper as well as of the correct grain and grade. In producing this special temper, the highest skill in abrasive manufacture is demanded.

Wrenches, Pipe, Monkey.
Bemis & Call Hardware & Tool Co., Springfield, Mass.
Trimont Mfg. Co., Roxbury, Mass.

Wrenches, Ratchet and Basin.
Bemis & Call Hardware & Tool Co., Springfield, Mass.

¶ The fact that the successful business man is an advertiser is usually incidental. He is an advertiser because he is possessed of good, sound business sense and an analytical mind. At some time or other he concludes that advertising could be made one of the mightiest factors of his organization, and having arrived at this decision, he just naturally went to it and advertised.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

Air Compressors.
A. R. Williams Machy. Co., Toronto.

GALT, ONTARIO
BUILDERS OF MACHINE TOOLS AND WOODWORKING MACHINERY

Coarse Tooth, Heavy Duty

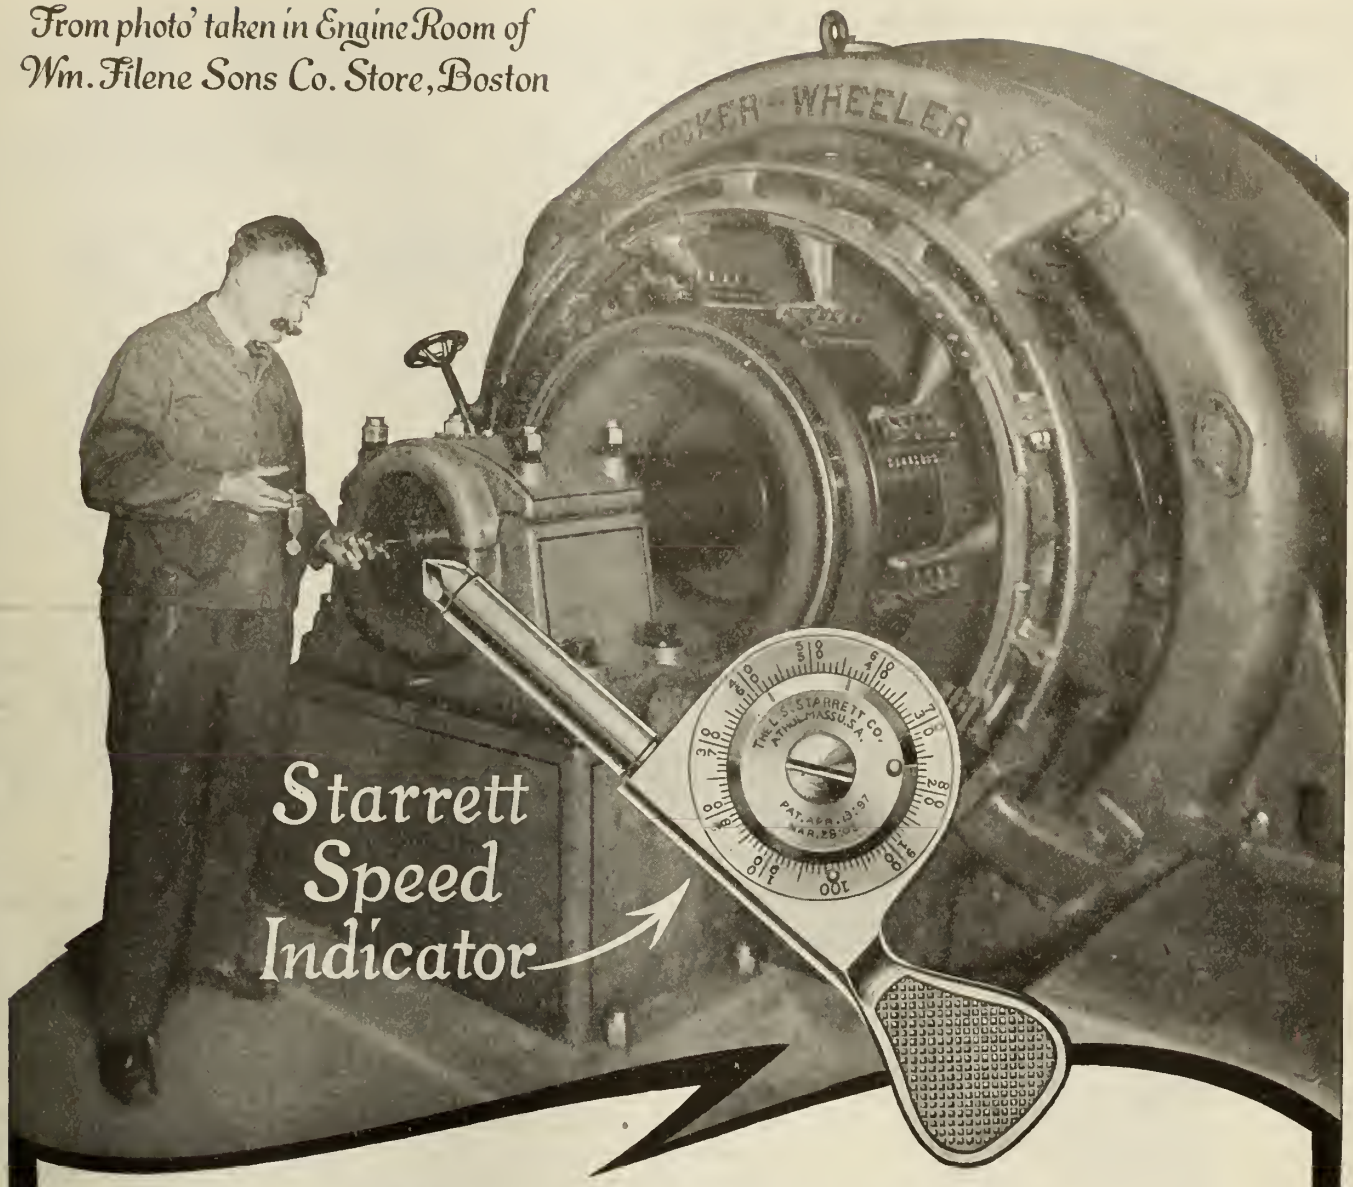
P. & W.
Milling Cutters

We are prepared to furnish promptly coarse tooth milling cutters of High-Speed Steel adapted primarily to the heavier class of milling.

Such cutters have the advantage of long life as the large teeth permit of more grindings. It will also be seen that less time is required to sharpen.

The ample chip room insures a remarkably free cutting action and will increase production by a high percentage with less power required to drive.

The teeth being larger are exceptionally strong and will easily stand the heaviest feeds without breaking.



Place a trial order with our nearest store.

Pratt & Whitney Co. of Canada, Ltd., Dundas, Ont.

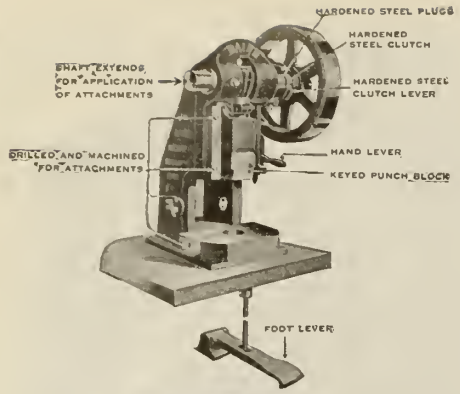
From photo taken in Engine Room of Wm. Filene Sons Co. Store, Boston

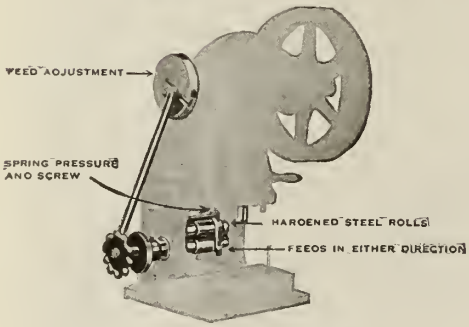
Every Mechanic Should Have a Starrett Speed Indicator

Men who work about machinery should have this indicator for taking speed on engines, generators, turbines, motors, line shafting, grinders, etc. It is the simplest, most accurate instrument made. It is especially valuable in taking speeds when computing engine horse power, etc. With the rubber wheel attachment it may be used to figure surface speeds. It indicates highest speed without heating. The parts are enclosed like a watch.



Made in three styles, prices $1.00, $1.50 and $3.00.

Send for catalog No. 203 to make your selection.



Buy Starrett Tools at any good hardware store. 42-308

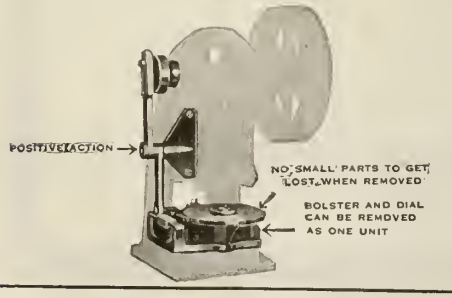
World's Greatest Toolmakers



$58 OPENS THE WAY FOR FULL AUTOMATIC MACHINERY

Our Open Back Power Bench Press No. 201 has been reduced to the very elementals of flexibility in equipment. Either Single or Double-Action Presses can be supplied.

The Plain Press can be purchased—as illustrated, to be fastened to a bench. Or a complete Press with Iron Table and Legs can be ordered. The Table can be ordered with the Press or it can be ordered at any time in the future. Both Press and Table are standardized.

A Back Roll Feed can be ordered with the Press or it can be ordered whenever requirements make it necessary. This Feed takes the metal from a reel and automatically draws it under the tool ready to be operated upon. It feeds in either direction, front to back or back to front, and by adjustment moves the metal forward any predetermined distance at each operation. There is no chance of accident when this attachment is applied as it takes away the necessity of hand operation and makes the Press a Full Automatic Labor Saving Machine.

A Side Roll Feed can be ordered with the Press or at any future time. This takes the metal from a reel in a similar manner to Back Roll Feed, but being attached to side of Press feeds the metal across the bed from right to left or left to right as may be desired. It allows of greater operating space for tools as the metal travels across the greatest width of bed and punch block. Rolls can be adjusted in relation to bed of press.

A Transfer and Automatic Stop Attachment can be ordered with Press or at some later date. This is used in connection with Back Roll Feed. After Press has reached the limit of operation under regular equipment the Transfer carriers or transfers the blank into position for one more operation. It allows one additional operation without rehandling to what would be possible without such attachment.

A Dial Attachment may be ordered with the Press or at any future time. A Dial Attachment will handle small partly finished objects with speed where it would be both dangerous and slow to feed directly to the tool by hand. Lift Pin for Dial and other variations of attachments making them suitable for particular purposes can be fitted.

Bulletin No. 201 gives Full Details and can be had for the asking.

MOST POWERFUL MILLING MACHINE

(Knee Type)

GARVIN No. 22, Plain Milling Machine, Compound-Geared. Use Code, "Aperient"

The machine shown is the most powerful Knee Type Milling Machine manufactured by us, having Compound Back Gearing whose ratio is 10 to 1, through steel gears. It will transmit 10 horsepower to 14-inch cutters, running 20 revolutions on steel castings. The machine has a wide-faced pulley of 11 inches in diameter, running loose on the spindle. The power is taken from the countershaft by a 6-inch double belt to this pulley and double-backed-geared back to the spindle. The machine has an arbor 2 inches in diameter, solid, with spindle, thus avoiding a lot of arbor troubles.

DIMENSIONS

Length of automatic feed of table	28 in.
Dimensions inside of oil pockets	43½x9 in.
Vertical adjustment	15½ in.
In and out adjustment	7 in.
Crated weight	3250 lbs.

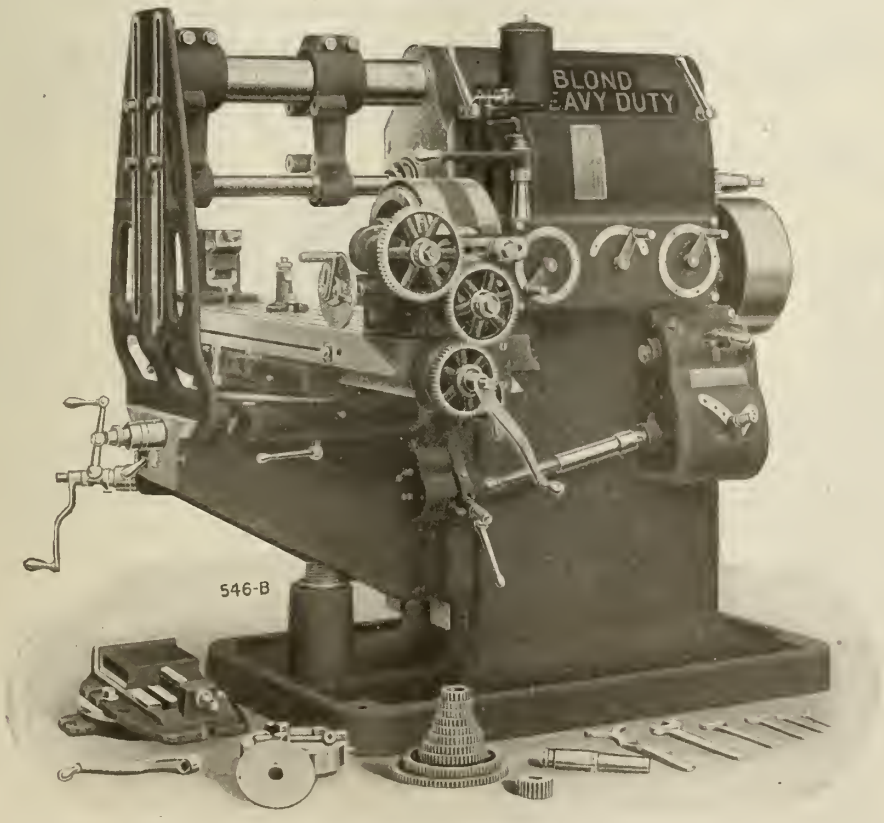
Milling Spirals With a KEMPSMITH No. 3 Universal With Universal Milling Attachment

You do not want to put a Universal Attachment on your tool room miller every time you want to mill a twist drill, a spiral milling cutter, or a spiral reamer. But if you have a

KEMPSMITH UNIVERSAL



and your spirals have too big an angle to be cut by swiveling your table, you can mount a Universal Milling Attachment, as illustrated right here, and the rigidity of your whole equipment and especially of your Dividing Head, will enable you to do work like this if you have a Kempsmith.

The worms are nearly 3 11-16" in diameter, and the depth of thread is nearly ¾". Each worm is 3⅜" long.

Roughing and finishing cuts are taken and each worm is finished complete in 43 minutes.

Let us send you bulletin of this No. 3 Universal, and also catalog.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

NICHOLSON MADE FILES

To Increase Output
To Insure Accuracy
To Save Time

USE MORE NICHOLSON-MADE-FILES

50 years of constant improvement have made NICHOLSON BRANDS the most efficient Files in existence.

They cut deeper—"hang" better—and last longer than any other file.

50,000,000 are used each year—because better files cannot be had.

Their use in your shops means more filing accomplished in less time and at lower cost. And by using two NICHOLSON-MADE-FILES to do the work you now do with one, you bring your filing-cost down to the lowest possible point.

To replace each file when it becomes half-worn, is to save the extra file-cost many times over, through swifter, more accurate work.

A week's trial in your shops of the "use more" plan is the best proof of economy we can offer. Start it to-day—with

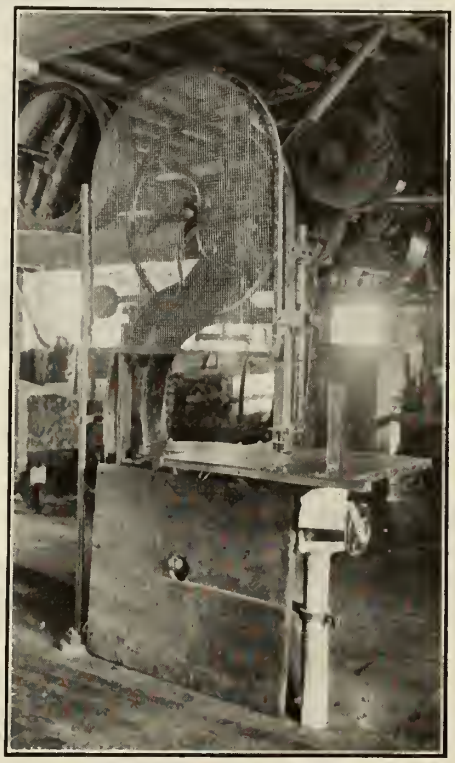
The Safety First Movement in the Industrial Sphere

By Riley Schenck *

The effectiveness of the Safety First movement to achieve high degree results in our workshops and factories has been amply proved wherever practised and, due to its unrestricted application, no plant is too small and unimportant to come within its scope and derive the benefits accruing.

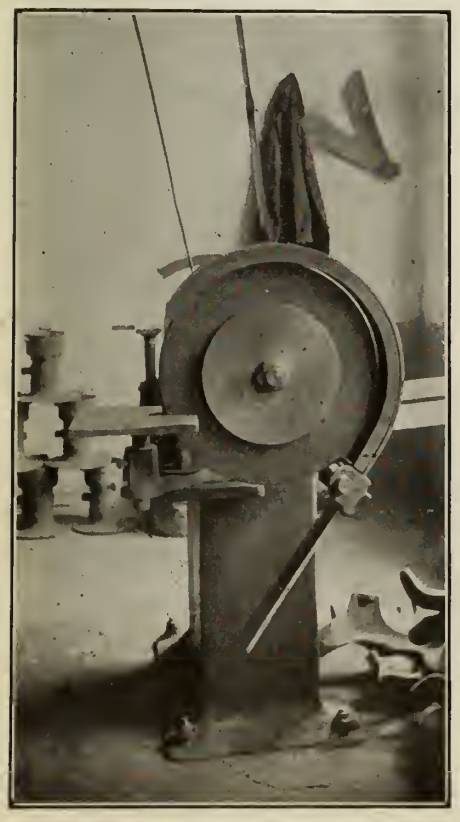


IN dealing with the subject of "Safety First" we must recognize that it is only a new adaptation of a very old principle. We have all been taught from childhood that self-preservation is the first law of nature, although, of course, many of us never took the lesson, and records show plainly that self is the least thought of element that enters into the alarming total of accidents in the industrial or community life. If all men thought more of themselves, there would not be so many who try to push a street car off the track with a motorcycle or auto, or who dispute the right-of-way with the "iron horse" in the railways. If men would think as much of others as they ought to think of themselves, we are sure that there would be far fewer accidents everywhere.

We are prone to talk about the speed of the age, and try to excuse our almost criminal carelessness, by the plea that we were in a hurry. The one lesson that "Safety First" impresses more deeply than any other is that it pays to make haste, slowly if necessary, but safely all the time. "Safety First" is awakened common sense; it is the applying of the old rule to your actions and thoughts in relation to others, as well as to yourself. In many of our large establishments more or less special thought is being given to the safety of employees. As a result, the employees are becoming aroused to the necessity of looking out for themselves and for the other fellow. A prominent United States manufacturer says: "The average individual at work for himself or in the pursuit of his own happiness will take more chances with his life and limb than are necessary for him to take in any employment, even as the state of protection stands to-day. There will be no change in this popular disregard for personal safety until there is an established public conviction, an active, yet sub-conscious state of mind, that automatically thinks of "Safety First."

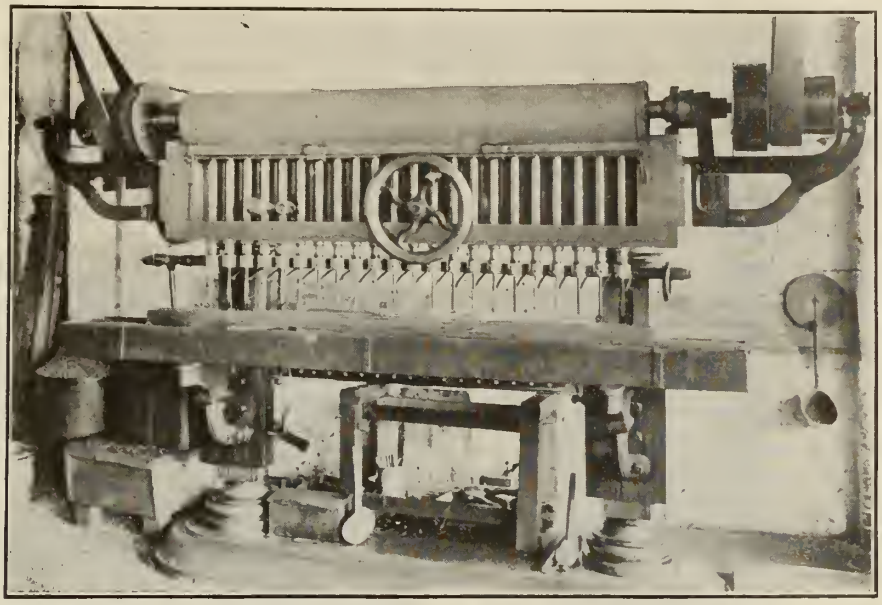
No employer designedly exposes his employees, and on the other hand, it may be said that few workers purposely put themselves in harm's way. Years of education and sad experience have taught even the most heedless of men owning property that it pays to prevent fires. Such precautional measures with reference to fires are second nature to most people, and the same thought must be created on behalf of accident prevention. The same relation must exist in all minds, with reference to accidents, as exists with reference to contagious diseases. It may be the work of a generation or more to bring everyone to this state of mind.

"Safety First" education should commence from the cradle, be carried through the public schools, and then to the occuptional field. All classes must be made to recognize its force from a standpoint of preventing human waste and effort. There will always be indifference, yet this may be largely overcome if the teachings are sufficiently impressive and started early enough in life. A "Safety First" campaign in any industrial plant, if properly carried out under the supervision of an expert in accident prevention, will positively reduce losses, under compensation, or any other system of insurance, and, while such campaigns are a new thing in industrial life, only dating back a few years, the records are undisputable. The following instances may be interesting:



Fred McKee, chief safety inspector of Fairbanks-Morse Co., Beloit, Wisconsin, states that the records of accidents for the year 1912, compared with 1906 shows a reduction in days lost on account of injury of 72 per cent. This company employs about 2,000 men. Mr. McKee estimates that 40 per cent. was saved by the installation of safeguards, 50 per cent. by education, organization and inspection, and 10 per cent. by improved shop conditions. Dr. F. D. Patterson, safety department of Harrison Bros., paint factories, Philadelphia, Pa., states that the reduction of accidents for 1913 over the previous year was 69.7 per cent. They employ about 900.

Band Saw with Wire Guard Over Top Wheel, Board Over Lower Wheel, and Tube Over Saw From Guide Up, Movable With Guide.



The Industrial Commission of Wisconsin reports a reduction of accidents of 26 per cent. for April, May, June and July, 1913, over corresponding months in 1912. The writer has records of reduction in plants in the United States running from 40 per cent. to as high as 95 per cent. in some special lines. The best information obtainable will justify the statement that in the United States in the last three years accidents have

*Canadian Safety Engineering Bureau, Toronto.

Emery Grinder with Taper Wheel, Safety Flanges and Band Type Guard.

been reduced on an average of about 42 per cent. in all industries, and that about 30 per cent. of this reduction is due to mechanical safeguards and 70 per cent. to inspection and education. In each case it is essential that the dangerous places should be looked up and properly protected, and plans must be devised to secure the co-operation of all classes of men to use the safety devices and practice safety principles.

22-Spindle Drill Press With Gears Guarded.

Accident Prevention in a Nutshell.

Accidents in several large industrial concerns in which the hazard is above the average have been reduced 66 per cent. through systematic effort.

Only one-third of this reduction has been accomplished by the use of mechanical guards.

The other two-thirds of the reduction has been accomplished by the following means:

Careful instruction, especially of new men, regarding danger.

Constant and rigid inspection by foremen and by committees of workmen.

Discipline of men who refuse to co-operate for safety.

Boost for safety meetings of foremen and workmen; this keeps up the interest and enthusiasm.

Make the workmen partners in safety work. Give them something to do and make them realize their responsibility; make them understand that a large percentage of accidents can be prevented only through their efforts.

Many large plants are now doing much work along accident prevention lines, with their own organizations, and many of the smaller ones would like to do the same, but are afraid that the expense will be too great. This is a mistaken idea. The services of an expert engineer for a few days to outline what steps should be taken, and how to take them; with a few instructions to your own repair men, or shop foremen, will enable any shop to go forward on its own. There are reasons why an outside expert should be used. He has the special training to see the conditions as they relate to the laws and to his past experience in accident prevention; the places are not familiar to him from association, so that he is sure to note the danger points that those regularly employed will pass over from their very familiarity with them. A reliable expert can not only tell you what you ought to do, and how to do it, but he has on file what other factories have done, also the names and lines of those who are now making a speciality of manufacturing safety devices, etc.

A workmen's compensation law has been passed, and it is now the duty of every Canadian manufacturer in his line of business to do all he can to see that it has a fair trial, and if such a stand be taken it will be a great step in advance for Canada, and will result in good for all classes. It will engender harmony, efficiency, more and better work, and in the near future more profit for all.

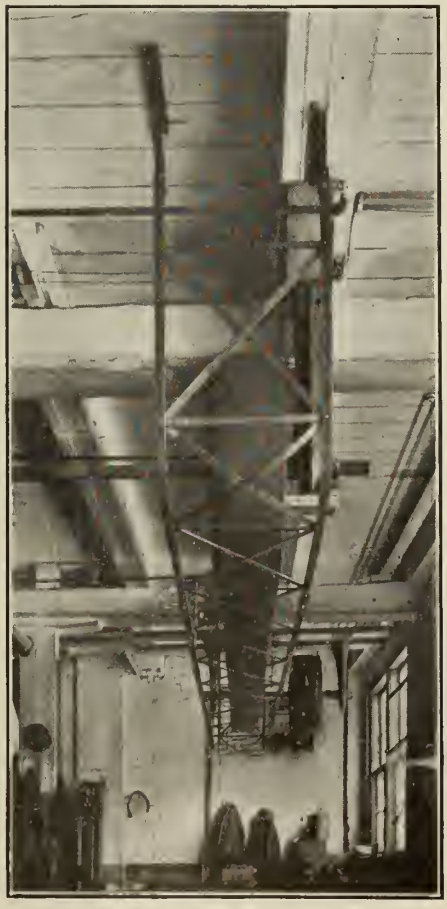
The writer spent six months in the Massey-Harris plants, Toronto, promoting a "Safety First" movement. The results were very satisfactory, many hundreds of possible danger points being covered or removed, while improvements were made all along the line. This plant was in better shape than many that the writer has been in before and since, the superintendents of the various branches being capable and careful men, who had been doing everything possible to promote safe conditions. In spite of this, an outsider, with the experience and vision, found hundreds, yes, thousands, of previously unnoticed possible danger points, and the management was very quick to furnish the protection, as soon as shown where the danger was, or what to do to prevent it. The work is still going on, and there will always be

New Style Guards for Vertical Planer.

more to be done, for after a plant is fully covered, it is essential that a careful and persistent inspection should be kept up, daily if possible, but at least

Semi-Automatic Collapsible Elevator Gate Closed.

once a week, to see that everything is kept up to a standard.



It is just here, however, that most of the plants will fail. The foremen are busy and allow the matter to drop or become a little careless in following it up, and the men with that sixth sense that they seem to possess, "sense" the fact that the "old man" is not interested in "Safety First" any more. The guards will come off and be left off and dropped in the corner. An accident will happen, and the "old man" will storm around for awhile, blaming everyone, except himself, for the neglect, fix things up again and then forget. This is the very worst condition possible for a shop. It is the patient, persevering work along safety lines that counts. Education is what is wanted. Habits must be formed, and we all know that these are not formed at once. They are the slow growth from doing or seeing the same thing over and over again, and for that reason it is necessary to have a safety committee, composed of a high officer (the general manager or vice-president), the superintendent, one or two popular active foremen, at least two workmen and the safety inspector, making a committee of five or seven men.

We have found it very profitable to have three workmen upon the committee, and in many places a position on the committee is a reward of merit, for special interest shown along safety lines. The constitution may be changed frequently, leaving the workers on for one or two months only, and then appointing others; those who have served one term being recognized as advisory members afterward, and consulted now and then about safety matters. This is the best system that we have developed so far to get and hold the interest and co-operation of the rank and file of the shop employees, and where such a plan is not started, most of the work accomplished will go for naught, and the safety engineer be dubbed a failure; while all the time it is not his fault, but the shortsightedness of the management of the plant served.

"Safety First" in the shop is not only saving money in compensation saved, it is humanitarian work. It saves lives, prevents suffering, pain, sorrow, heartaches of wives and children, and loss of production as well; it means contentment, harmony, better feeling and, therefore, more efficient workmen. I quote a few paragraphs from a paper by G. L. Avery, Peoria, Ill., as to the effects of the Safety First and compensation systems when taken up intelligently by a large firm, and carried out systematically.

After giving in detail the mode of procedure, and the equipment of the first aid department, before and after April 1, and the results, Mr. Avery adds that no matter from what viewpoint we look we see the same results:

Personal interest means closer contact.

Under Belt Guard.

Closer contact brings quicker response.

Quicker response insures better care.

Better care secures more contentment.

More contentment produces better work.

Better work yields more profits.

Elevator Gate Open, Showing Clearance and Small Space Needed.

More safety means fewer accidents.

Fewer accidents result in less lost time.

Less lost time brings more steady work.

More steady work produces increased efficiency.

Increased efficiency assures greater output.

Greater output yields more profits.

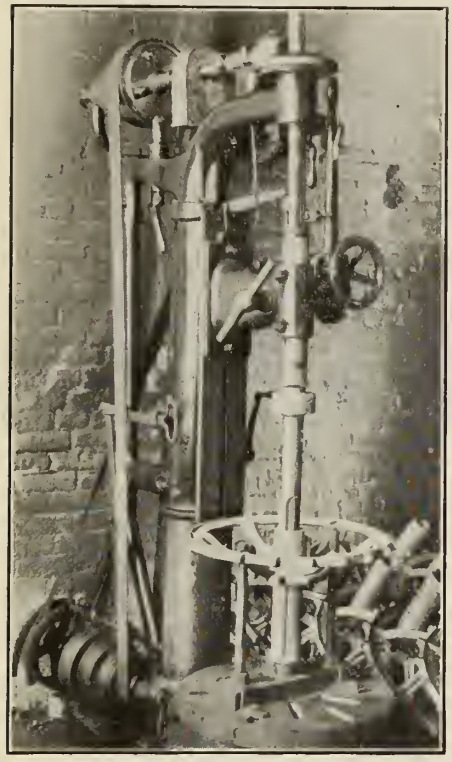
It is our definite policy, because we believe the goodwill of our men is a valuable asset to the business, to have the men understand that we do not desire to hide behind any technicalities in the law, that we are giving them an absolutely square deal; that we are interested in keeping them sound and healthy, because we believe it is for their own good; and to this end we do nothing to antagonize our men; we have them sign no reports of their injuries which they might construe to mean that we are trying to avoid paying them compensation. After a serious injury, the employee is not allowed to return to the same job on which he was injured on account of the mental hazard in connection therewith. He is allowed to return to his regular work a little later if found advisable.

A record of six months' operation, from April to October, 1912, may be interesting, for several reasons. Employment is given to about 2,200 men.

Total examined, 2,179.

Injuries (every scratch is an injury), 648.

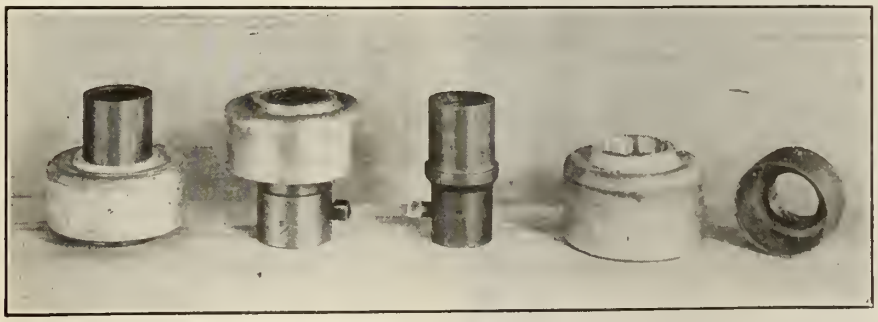
Ears cleaned, 128.



Later dressings, 1,772.

Minor treatments, 451.

Eye and ear tests, 17.



Reported, but no treatment, 135.
Doctor calls at employee's homes, 13.
Calls at doctor's office, 7.
Teeth and gums, 9.
Eyes treated, 205.
Operations, 18.
Fractures, 6.
Total, 5,592.

I believe that the Avery Company has gone into this matter on the broadest

Upright Drill Press Guarded.

and soundest plan of any that I am acquainted with. No plant is too small to be profited by a careful study of conditions and persistent efforts to reduce the hazards of accident or fire, for it will be harder for the small firm to meet the expenses from a fatal accident than the larger firm. With only a few men to be essential to the business, their places are harder to fill than in the large plant, where men can be transferred who are more or less familiar with the work.

Aluminum Collars to Cover Set Screw Heads on Drill Press Stub Ends.

Breaking in a new man is expensive; he will not produce as much for a few days, is more liable to spoil work, and is also more liable to be injured than the older men. The safety inspector of the Yale & Towne Co., Stamford, Conn., after a very logical deduction at one of the round table conferences of the Safety Engineers of America, said that even where a large percentage of unskilled labor is employed it costs considerable to break in a new man. He estimated that it cost the company he represented $10 for every new man.

The smaller plant will be at a disadvantage in starting "Safety First" campaigns, in that they cannot afford to have a special man to look after the work all the time, but they can still afford to have an expert a few hours once a month to inspect the premises and give the foreman the ideas necessary to keep the plant just as safe and up-to-date as the large manufacturer, who can afford to have safety engineers and inspectors and departments, as he desires to carry on the work.

The illustrations accompanying this article are from the Massey-Harris plant, Toronto.

SELECTION OF CHAIN GEARING.

A PAPER upon "The Selection of Chain Gearing" was read before the Birmingham and District Electric Club recently. The author stated that the chief factors affecting the question of chain gears were power, speed, gear ratio, the position of the drive, the distance between the shafts, and the direction of rotation. Much valuable information was included upon the design of chain drives, and convincing examples showing the savings in power and increased efficiency were given and illustrated by lantern slides. Notes upon the treatment of chains and the use of shock absorbers and fly-wheels were given. The importance of adequate lubricating arrangements and the advisability of gear cases where possible was emphasized, as affecting the life and satisfactory running of the chain. Figures were submitted showing that in many cases the first cost of a chain drive was lower than a belt or rope drive, while the life of a chain was invariably greater than the life of ropes or belts.

MOTOR CAR INDUSTRY IN CANADA

During the past twelve months Canada has imported over seven thousand motor cars from the United States, the total value of which was slightly over $9,000,000. Five year previous Canada bought only 385 cars from United States makers and their value came to $700,000 In 1913, which was far from one of the brightest commercial years, the records show an importation of 934 cars over the number for 1912.

There are between fifty and sixty thousand motor cars at present in the Dominion, and the average price runs between $1,500 and $1,700. This takes into account the preponderance in all sections of the Dominion, and for all purposes, of the low-priced cars, together with those of Canadian manufacture which are in the relatively high-priced class. Canadian manufacturers have never attempted, as yet, to dispute the sovereignty of the American car of $1,000 or under and have confined their efforts to makes of heavier and more elaborate design and power.

At a recent meeting of one of the leading Canadian companies, where the year's turn-over had not been particularly encouraging, an effort was made by certain shareholders to stampede the management into the cheap car field. The reply of those in charge was that the additional machinery for such a purpose would cost nearly $200,000 and the chances of successful competition would even then be distinctly uncertain. It is quite unlikely, therefore, that the standards or prices of Canadian cars will undergo any radical change in the near future.

The absence of the English-made automobile on the Canadian market continues to excite the wonder of foreign visitors. Under the Preferential Tariff, cars from the Old Country enjoy a reduction of duty from 35 to 22½ per cent., ad valorem. The importations, however, are almost negligible — something like two per cent.—in comparison with the annual sales of domestic and United States makes.

Motor trucks make a good deal of progress in the larger Canadian centres, particularly trucks of the heavy tonnage class. Retailers requiring a half-ton or quarter-ton maximum usually purchase a low-priced passenger car and use the chassis and engine as foundations for any special body they wish. While hundreds of auto deliveries may be noticed in the bigger centres, the contagion has been confined far within the predictions of a few years ago, and the horse still preponderates in the bulk of retail delivery. Electric pleasure cars of both Canadian and United States makes have upheld a steady sale in the cities, but are little used elsewhere.

The Effect of Electrical Engineering on Modern Industry *

By Charles P. Steinmetz **

In Section I. of the accompanying article, energy in chemical and electrical form is discussed and comparisons made, while in Section II. the part that distribution of materials and energy play in our civilization is treated also from the comparative achievement standpoint of chemical and electrical energy.

SECTION II.

CIVILIZATION results in the complete interdependence of all members of society upon each other. Amongst the savages each individual, family, or tribe is independent, and produces everything it requires. In the barbarian state some barter develops, followed by trade and commerce with increasing civilization; but up to a fair state of civilization —up to nearly a hundred years ago— all necessities of life were still produced in the immediate neighborhood of the consumer, each group or territory still independent in its existence, and commerce dealing with such things only which were not absolutely necessary for life. All this has now changed, and in our necessities of life, as well as in our luxuries, we depend on a supply from distances of hundreds and thousands of miles; the whole world contributes in the supply of our food, clothing, building materials, etc.

This means that our existence is dependent on an efficient and reliable system of transportation and distribution of all needs of civilized life. Such has been developed during the last century in the system of steam railroads, which, in taking care of the transportation and distribution of commodities, have made modern civilization possible. Civilization means separation of production, in time and in location, from consumption, to secure maximum economy.

Necessities of Civilized Life.

The necessities of civilized life consist of two groups: materials and energy. Our transportation system takes care of materials, but can not deal with the supply of energy, and the failure of an efficient energy supply has been and still is the most serious handicap which retards the advance of civilization. The transportation system could deal with the energy supply only in an indirect manner, by the supply of materials as carriers of energy, and when our railroads carry coal it is not the material which we need, but the energy which it carries. This energy is available, however, only to a very limited extent, as heat and as mechanical power in big steam units; therefore most of the energy demands of civilized life could not be satisfied by it.

In any country village far away from the centres of civilization we have no difficulty in having delivered material produced anywhere in the world; but even in the centres of civilization we could not get the energy to run a sewing machine or drive a fan without electric power. Thus, just as our steam railways and express companies take care of the transportation and distribution of materials, so civilization requires a system of transmission and distribution of energy, and our electric circuits are beginning to do this; and just as fifty to seventy-five years ago in the steam railroads, steamship lines, etc., the system of transportation and distribution of materials was developed, so we see all around us in the electric transmission systems the development of the system of the world's energy transmission in progress of development.

When we see local electric distribution systems combining, the big electric systems of our capital cities reaching out over the country, transmission lines interconnecting to networks covering many thousands of square miles, this is not merely the result of the higher economy of co-operation, of mass production, but it is the same process which took place in the steam railroad world some time ago, as a necessary requirement of co-ordination to carry out their function as carriers and distributers of materials in the case of the railroads, of energy in the case of the electric systems.

We must realize this progress, and the forces which lead to it, so as to understand what is going on, and to assist in the proper development, in avoiding, in the creation of the country's electrical network, whatever mistakes have been made in the development of the country's railway network.

Electricity, then, is taking over the energy supply required by civilization as the only form of energy which, by its simplicity and economy of conversion, combined with economical transmission, is capable of supplying all the energy demands, from the smallest domestic need to the biggest powers. As we now begin to realize, the economic function of the steam engine is not the energy supply at the place of consumption, from the chemical energy of coal—it is too complicated and inefficient for this—but it is the conversion of chemical energy of coal into electrical energy in bulk, for transmission and distribution to the places of consumption.

Electrical Power and Industrial Methods.

If, then, electric power takes the place of steam power in our industries, etc., it is not merely the substitution of the electric motor for the steam engine or turbine. Such would rarely realize the best economy. The method of operation in all our industries, and especially those requiring considerable power, is largely —more than usually realized—determined by the characteristics of the power supply, and what is the most economical method with the steam engine as source of power may be very uneconomical with electric power supply, and electric power supply often permits a far more economical method of operation than was possible with steam power. Thus the introduction of electricity as the medium of distributing the world's energy demand means a reorganization of our industrial methods, to adapt the same to the new form of power.

For instance, the steam engine requires skilled attendance, and with its boiler plant, auxiliaries, etc., is a complex apparatus, and is economical only in large units. Thus, when operating a factory or mill by steam power, one large engine is used, driving by shafts and counter-shafts, by pulleys and belts, and possibly wasting half or more of its energy in the mechanical transmission to the driven machines. We could not, however, economically place a steam engine at every one of the hundreds of machines in the factory. Substituting electrical power by replacing the engine by one large electric motor would be very uneconomical, as we can place a motor at every driven machine, and these small motors are practically as efficient—within very few per cent.—as one big motor would be, and all the belting and shafting, with its waste of energy, inconvenience, and danger, vanishes.

With the steam engine as source of power, to run one or two machines only, to complete some work, it means keeping the big engine in operation, and therefore contributing to waste. With individual electric motors the economy is practically the same whether only one or two motors are used, or the entire factory is in operation. On the other hand, with the steam engine, it makes no difference in the cost of power whether it is in operation from 8 a.m. to

*From the Journal of the Franklin Institute.
**Chief Consulting Engineers, General Electric Co.

6 p.m. or from 6 a.m. to 4 p.m. With electric power, in the former case the power demand would overlap with whatever lighting load the same supply circuit carries, but would not in the latter case, and the latter case thus would give a better load factor of the electric circuit, and thereby a lower cost of power. Again, with electric power, if very large power demands could be restricted to the period of light load on the electric supply systems, this would reduce the cost of power. Nothing like this exists with the steam engine.

Electrical energy thus makes the power users economically more dependent upon each other, and thereby exerts a strong force toward industrial co-ordination—that is, co-operation.

The Traction Problem.

Another illustration of the industrial reorganization required to derive the full benefit of electric power is afforded by the traction problem. Very often a study of the electrification of a railway shows no economical advantage in the replacement of the steam locomotive by the electric locomotive, even when considering only passenger service. At the same time, an electric railway may parallel the same steam railway, offer better service at lower price, and show financially better returns than the steam railway. In the early days of steam, the steam engine in place of the horse in front of the stage coach was no success, and still the stage coach has gone and the steam locomotive has conquered; but it did not by replacing the horse, but by developing a system suited to the characteristics of the steam engine. The same repeats now in the relation of steam traction and electric traction.

The steam engine is most economical in the largest units, and the economy of steam railway operation depends on the concentration of the load in as few and as large units as possible: therefore, the largest locomotive which can pass through bridges and around curves. Exactly the reverse is the condition of economy of electric traction; the economy depends on the distribution of the load as uniformly as possible in space and in time—that is, small units at frequent intervals—and therefore, while steam traction has gone to larger and larger units, in electric traction even the trailer car, so frequently used in the early days, has practically vanished.

Obviously, then, the electric motor can not economically compete with the steam engine under the conditions of maximum economy of steam and minimum economy of electric operation, and electric traction under steam traction conditions shows marked economy only in the case of such heavy service that the maximum permissible train units follow each other at the shortest possible intervals—that is, give maximum uniformity of load—and thus the economic requirements of both forms of power coincide. These two instances may illustrate the changes in industrial operation which the introduction of electric power requires and which are taking place to-day.

TRUING WHEELS FOR RAPID AND ACCURATE GRINDING.

By Charles H. Norton.

WHEN considering the question of truing grinding wheels, one should not become confused with dressing grinding wheels, because the dressing of a grinding wheel is altogether a different matter. Dressing is done to rough up a grinding wheel as well as to true off the high points and make the wheel approximately concentric, but truing a wheel as understood by users of wheels for grinding cylindrical and accurate surface work is not roughing the wheel, but making it very accurate as to concentricity and surface. Even this class of truing may be divided again into two kinds, one for sharpening the wheel as well as for making it perfectly true, and the other for dulling the wheel while making it perfectly true—that is, putting a very smooth surface upon the wheel.

Accurate truing, which is not dressing is accomplished with a diamond, and this diamond should always be held in a fixed tool post, never in the hand. There should always be a liberal supply of lubricant or water flowing on the diamond while the truing is being done. Allowing the water to be on the diamond part of the time and off part of the time is very bad for the diamond, and also it prevents the operator from securing a perfectly smooth wheel face.

With modern cylindrical grinding and modern surface grinding a relatively coarse wheel is used for removing the greater part of the material that is to be removed, a wheel so coarse that its grain will not allow, when cutting freely, of a finish fine enough. We, therefore, after removing the material, require just before finishing to true the face of the wheel with a diamond that does not have a very sharp point, but preferably has a small rounded, or perhaps considerably rounded, point. Then by very slow passing of the diamond over the face of the wheel when the diamond is held in a fixed tool post, we create a surface on the wheel which is smooth, and at the same time perfectly true. The surface is a temporary one on this otherwise coarse wheel, but by careful application of the wheel to the work, not to disturb its surface, we secure a finish on the work. In other words, the quality of the finish on the work depends upon the quality of the surface on the wheel.

When a second piece is to be ground roughly, a relatively deep cut is taken by the wheel; this smooth surface disappears, and we have the coarse wheel in action again.

Many times it is necessary to true a grinding wheel perfectly because chatters have occurred in the work, due to uneven wear of the wheel or vibration of the work itself. Careful re-truing and smoothing the face will secure accurate ground work always, if this truing and smoothing is done carefully.

Some people still use for cylindrical grinding wheels that are fine and dense. These people require a diamond with a sharp point in order that they may somewhat rough up the surface of the otherwise too smooth a wheel. In this case, as in the other, water must flow on the diamond all of the time when it is cutting, but instead of very slow passes across the wheel, a few more rapid passes are required for this class of truing; but in no case for accurate work should one presume to use a so-called wheel dresser. It is impossible by its use to do cylindrical grinding that is any way accurate. For accurate cylindrical work the most profitable wheel to use is one that requires frequent truing. It is a mistaken idea that many have, that truing a wheel is lost time and expensive.

In other forms of grinding of a less accurate nature, the so-called wheel dresser is used to advantage. Even there it should be held in some kind of a guide or tool post to secure as true a wheel as possible, although the cutters of the wheel dresser are roughing the surface to give the wheel a more rapid cutting surface. It would probably be more profitable that a wheel soft enough to keep free cutting without the use of a dresser could be used, were it not for the fact that many workmen become careless and break into a soft wheel, causing it to run out of true quickly and to be wasted. Therefore, a somewhat harder wheel is used, requiring in some cases dressing to increase the production.

The popular idea of a diamond for truing a wheel is that it should always have a sharp corner in order to cut sharply on the wheel, and make the wheel face perfectly sharp. This idea is so prevalent that it has been suggested by one writer that the diamond be revolved while truing the wheel. After thirty years experience with grinding, the writer believes that the most useful diamond is the one that does not have a sharp corner, and the most useful wheel is one that is sufficiently soft and coarse that when trued it is made more dull than if not trued, for the reasons given above.—Grits and Grinds.

PRODUCTION METHODS AND DEVICES

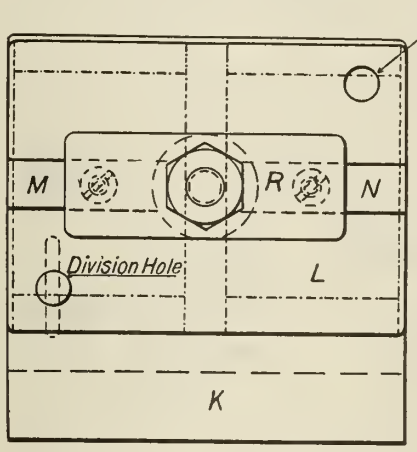
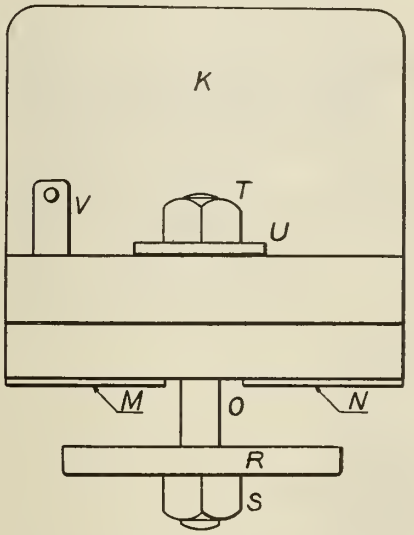
FIXTURE FOR MACHINING SMALL SLIDES.

By W. G.

THE drawings herewith illustrate an accurate and inexpensive method of machining small machine slides, and will, if reasonable care be exercised, produce work of first-class finish, thus eliminating to a certain extent, the tedious operation of scraping. With reference to the accompanying cuts, Figs 1 and 2 are elevation and plan of the fixture for the first and third operations. Figs. 3, 4 and 5 are front, side elevation and plan of the swivel fixture for the second operation, i.e., milling slide faces.

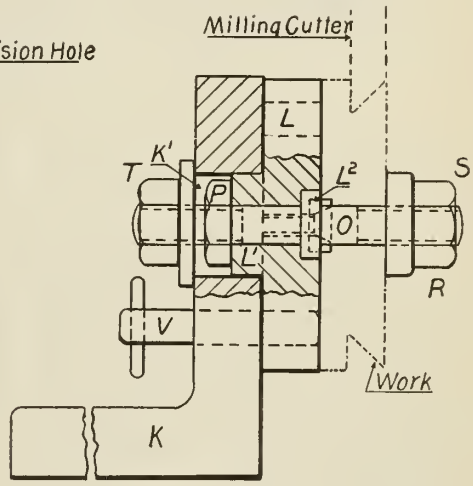


With reference to the fixture for the first operation Figs. 1 and 2, the body A consists of a rectangular iron casting provided at its extreme ends with two projections A^1 and A^2. The former serves the purpose of a stop and the latter for carrying the clamping screw. The locating pegs B, C, D, and E, are made from silver steel and should be a tight fit for the holes in the body. The square blocks F and G carrying the set-pins H and I are provided with turned ends as shown. These also should be driven tightly into the base. Part J is the clamping pin. This is made from mild steel and should be casehardened at the end in order to prevent "burring." The four corner holes are for securing the fixture to the machine table.



The second operation fixture Figs. 3, 4 and 5—machining slide faces—is made to swivel, the object of this being to provide means for machining both slide

Figs. 1 and 2. Elevation and Plan of Fixture for First and Third Operation.



faces of the work at the one setting of the fixture. The body K consists of a cast iron angle bracket having a central hole K^1. Its purpose is to provide location for the swivel plate L, which consists of a rectangular cast iron plate provided at its inner face with a circular projection or spigot L^1. On its opposite face is a longitudinal grove L^2 for receiving the locating strips M and N; these being secured to the swivel plate by means of the countersunk screws as shown.

The part O or clamping pin should be a tight fit in the swivel plate L and is finally secured in position by means of the lock nut P. The clamping strap R is made of mild steel and need not be machined beyond drilling the pin hole. Parts S. T. U. are the clamping nuts and washer respectively. The dividing plug V is casehardened mild steel suitably ground and should be a good sliding fit in the holes.

The sequence of operations is as follows:—The components, shown dotted, are first set in position on the swivel plate L. They are located by the blocks M and N engaging with the rectangular tongue slots formed on the under side of the components. The work is finally

Figs. 3, 4, 5. Front, Side Elevation and Plan of Swivel Fixture for Second Operation.

secured by means of the clamping strap R and the nut S. After the first side has been machined, the fixture is reversed in order to machine the opposite side of the component, this being performed by withdrawing the plug V and giving the swivel plate a half turn. This brings the opposite division hole into alignment with that in the body K. The plug is again passed into position, the clamping nut T tightened, and the component is thus prepared for the second machining process.

The first operation fixture Figs 1 and 2 is also used for the third operation—that of machining top surface—the only difference being that the work does not require to be located as in the first operation. This is accomplished by machining the tongue slot in the previous setting. Lateral location is quite unnecessary as the work is purely one of plain surface milling.

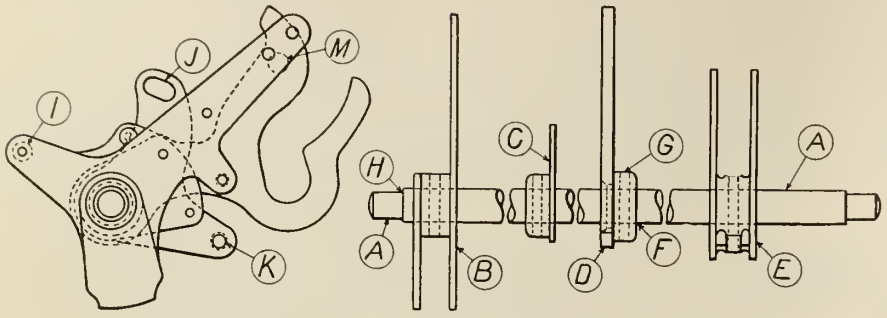
DRILL JIG AND GAUGING FIXTURE FOR ADDING MACHINE SHAFT.

By H. Burg.

In this article are shown two tools consisting of a drill and locating jig and gauging fixture for one of the operating shafts of an adding machine, to which are attached several arms or operating levers for various mechanisms. The assembled part is shown at Fig. 1, and consists of the shaft, A, to which are attached the several levers, B, C, D and E, to which are staked to hubs F, which

in turn fit the shaft and are fastened thereto by means of pins G. The holes through the hubs and shaft for these

The arms to be attached to the shaft are located in position in the jig in the following way: The hubs to which the



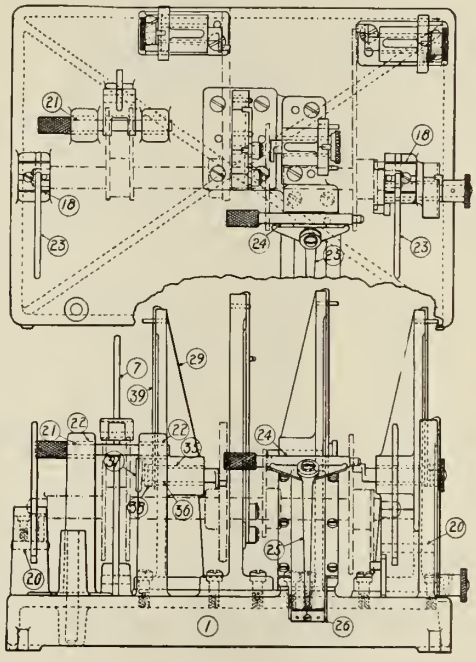


Fig. 1. Drill Jig and Gauging Fixture for Adding Machine.

pins are located and drilled in the jig, Fig. 2, which has some interesting features.

On a boss on the body casting, 1, is located a block 20 on one end, against which the shouldered end H of the shaft A bears. There are also four blocks, three of which support the shaft in the jig. The shaft is clamped down in the jig by means of two clamps, 4, and thumb screws, 5. The fulcrums for the clamps are the shouldered screws, 6, which have springs around them to support these clamps and prevent them from falling down when the work is removed. They are also provided with elongated slots in which the screws, 6, are a sliding fit, so that, when the drilling is finished, the clamps can be drawn forward out of the way.

The hinged leaf, 7, is an iron casting which swings on two pins, 8, and is clamped down by means of the thumb-screw, 9. This leaf carries the hardened drill bushings and is released by

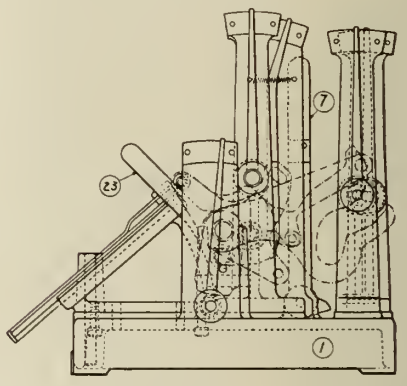

Fig. 2. Drill Jig and Gauging Fixture for Adding Machine.

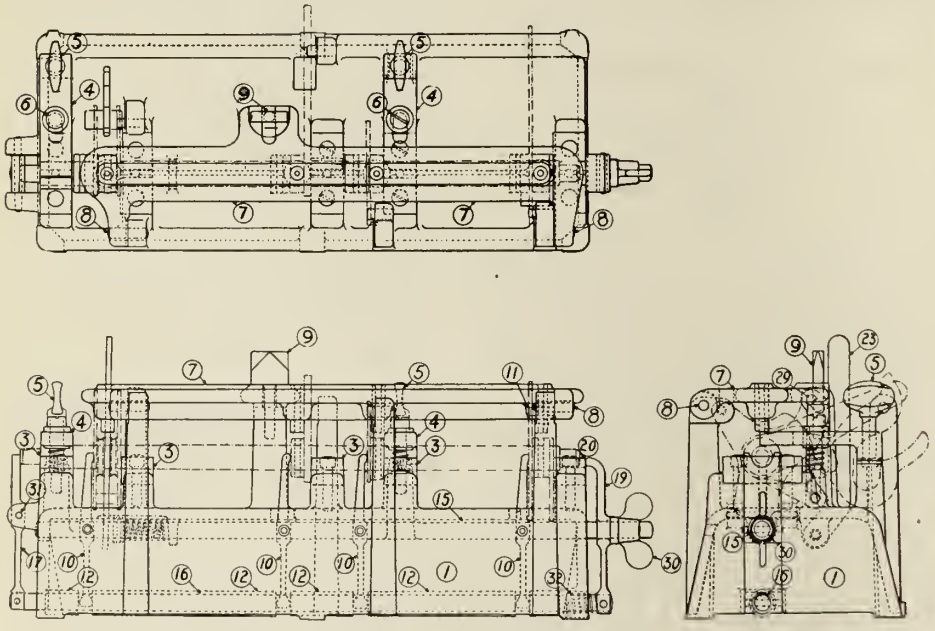

Fig. 3. Drill Jig and Gauging Fixture for Adding Machine.

a quarter turn of the thumb-screw, so that it can be raised when removing or placing the work.

arms are attached are pressed against the various blocks 3 by the yokes 10, which gives them the proper lengthwise positions. Arm B is located relative to the axis of the shaft by the hole I, and the pin 11. Arms C and D are set in the jig by holes and pins in the same way. The arm E is located by the slot J and a flat eccentric lever shown in the left hand end of the elevation, Fig. 3 which engages the arm by means of the pin K, Fig. I. The pin K is pressed down so that the locating pin which fits J always rests in the end of the slot.

The means of clamping the work in the jig are very ingenious; first vertically by means of clamps, 4, already described, and horizontally by means of two shafts, 15 and 16, which pass through the body casting from end to end. To the upper shaft, No. 15, are fastened a number of reverse yokes, 10, the fulcrums of which are at the bottom of the jig. The ends are slotted to straddle the shaft, 16, and bear against the ends of a number of loosely-fitting sleeves, 12.

The sleeves do not move, but the shaft moves freely through them. When the thumb nut, 30, is tightened, it draws shaft, 15, to the right, and the levers press against the hubs, F, thus holding the various arms against the locating blocks.

The end of the shaft being drilled is likewise engaged by a lever 17, having its fulcrum in a boss on the end of the jig body, and swinging on pin, 31. As the shaft, 15, is drawn to the right by tightening the thumb nut, the shaft, 16, is moved to the left by lever, 19, thus causing lever, 17, to press against the end of the work. When the drilling is finished, springs, 32, return the clamp lever to the open position, when the thumb nut is loosened.

For gauging the assembled mechanism, the gauge or testing fixture, Fig. 3, is employed. On each end of the base casting, 1, is a hardened block, 18, on which the shaft lies. The shaft is clamped and held down against the V's by means of the two swinging levers, 23, which are pivoted on pins, 20. The work is also held in the gauge and kept from turning by the pin, 21, engaging in the parallel

slot J in arms E. The removable pin, 21, fits into bushings, 22, in the bosses shown. The pin is made to bear at the end of the slot by the arms E being pressed down against the pin by the swinging lever, 7.

The function of the gauge is to test the position of the various arms in relation to the shaft arm and to the arms, E, and with relation to each other.

The arms B and C have holes, I, parallel, and this relation must be maintained. To gauge this, a pin, 24, is passed through the holes, and bears against the indicator arm, 25, by means of which any variation is shown on the graduated end of plate, 26, which holds the indicator arm.

The indicator arms are gauged by indicator devices which are quite similar in principle. The parts making up the one for the hole M in arm D are shown in detil for clearness. A cast iron bracket, 29, is screwed to the base casting and this bracket contains a bushing, 35, in which the gauge plug, 36, is a sliding fit. The gauge plug has a knurled plug, 37, fastened to it by means of pin, 38, and to the head is fastened by a pin the indicator arm, 39. The end of the plug, 36, is made to fit the hole M. When the work is in place in the gauge, the end of the plug is placed in the hole. If the arm is in the correct position, the indicator arm will register at zero on top of the bracket, and the other gauge plugs for the various arms being engaged with the work, all the indicator arms should register zero also, if the work is correct, and if not the variation may be read off by the graduations on the supporting brackets, thus making known the exact amount of the error.

Practical Methods of Laying Out Gear Teeth

By John Edgar

The ability to design the correct forms of gear teeth is now but little required of mechanics in general, the necessary knowledge being limited to that required to operate machines for the purpose. A knowledge of fundamental principles, however, if seen in a practical light and properly understood, will give one a conception of the requirements of gearing that is useful, if not essential to the correct application of gears to their various uses.

WHEN we consider the number of gears used at the present time, it may be safely said that no other piece of mechanism is so little understood by the average man of the shop. This lack of knowledge is partly due to the mechanical means at hand to form the teeth and the mystery that ever surrounds the subject in its theoretical form.

A simple treatment can be made of the subject that will give a clear insight into the method of obtaining the tooth forms so that they may be drawn on the board as easily as they are cut in the machine. In this article it will be necessary to consider the involute form of tooth, as it is to-day the only form that is in use the world over, and in dealing with it we will set forth some simple methods of constructing the true curve as well as easy ways of drawing practical approximations that will be even more useful.

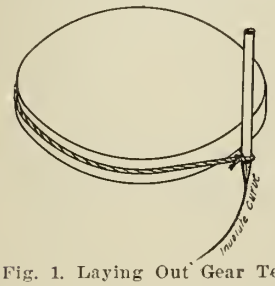

Fig. 1. Laying Out Gear Teeth.

The Involute Curve.

The involute is the curve described by a point on a non-stretchable cord as it is unwound from a disk. The top of a round can or a round box and a piece of fine strong string with a pencil suitably attached can be used for this purpose as shown in Fig. 1.

The geometrical method by which the curve may be drawn is shown in Fig. 2. Draw from O as a centre a circle which is to be the base of the curve or the circle from which the involute springs. Divide off on this circle a number of equal spaces a, b, c, d, etc., and draw tangents to these points on the circle. This can be done by drawing radial lines from the centre through the above points and then drawing the tangents at right angles to these radii. Now on the tangent at a, mark-off from the point of tangency a, a space equal to one space already laid off on the circle. Likewise on the tangent at b measure off two spaces and continue to lay off on successive tangents a number of spaces equal to the distance in spaces from the starting point on the circle. This done, a curve connecting the last points on the tangents will be the involute with the circle as a base. The curvature of the involute will depend on the diameter of this circle and all involutes drawn from any given circle as a base will be alike.

The involute curve is adaptable to the needs of tooth gearing in that two opposite involutes to any circle as a

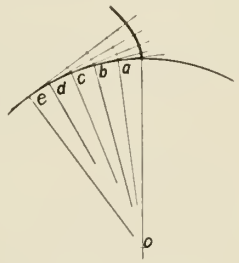

Fig. 2. Laying Out Gear Teeth.

base will roll together on one another with uniform motion as in Fig. 3. The direction of the contact pressure is at right angles to the curves and lies along a line tangent to both base circles of the involutes in mesh.

The point of contact of a single pair of teeth moves along the lane a a, Fig. 3, as the gears revolve and the angle at which this line stands depends upon the distance between the centres of the base circles being greater as this distance increases. For a given angle of this line of contact the centres of the base circles are at a relative distance which cannot be altered so long as this angle remains the same. In gear tooth language, this line of contact is called the pressure line and its direction is along the line of the pressure between the teeth.

The curvature of the involute decreases as the diameter of the base circle from which it is drawn increases. That is as the circumference of the base circle becomes more nearly a straight line so the side of the involute tooth also becomes straight. For this reason the sides of the rack tooth are made straight and are inclined to the vertical with an angle equal to that of the line of contact.

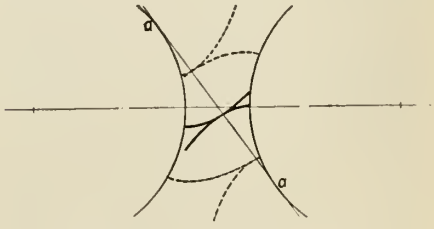

Fig. 3. Laying Out Gear Teeth.

Standard Angle of Contact.

In the standard involute tooth system, the pressure line is inclined at an angle of 14½ degrees with the common tangent to both pitch circles. This angle was adopted as the minimum angle that could be used in an interchangeable system of gearing in which 12 teeth is the smallest number that can be used to

mesh with another pinion of equal size and give uniform motion.

In Fig. 4 are shown the different terms as applied to the parts of the gear tooth. In gearing of the standard form, the thickness of the tooth (t) at the pitch line is made equal to the space in all cut gears, and is thus one-half of the circular pitch of the tooth. In cast gears this thickness is usually made smaller than the space or .48 x P^1. The addendum S that part of the tooth above the pitch line is made .318 times the circular pitch P^1. When the pitch of the gear is based on the number of teeth in the gear per inch of diameter we call it the diametral pitch, and equals the pitch diameter divided by the number of teeth. The addendum of the tooth is equal to the reciprocal of the diametral pitch. As for example, 30 (teeth), divided by 3 (in. dia.) gives 10 as the diametral pitch and the addendum is 1-10 in. The whole depth of the tooth space is equal to twice the addendum (S) plus the clearance (f) and is equal to .687 times the circular pitch P^1. The clearance (f) is equal to one-tenth of the thickness of the tooth at the pitch line in cut gears, or (.1t).

In Fig. 4, attention is called to the location of the pressure line (e f), and the tangent base circle in their relation to the pitch circle of the gear and the pitch line (c d) of the rack. The point

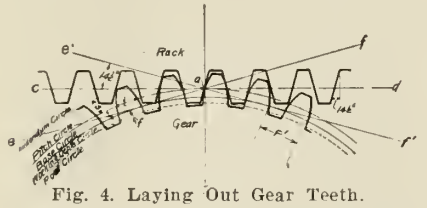

Fig. 4. Laying Out Gear Teeth.

(a), where the pressure line crosses the pitch circle is called the pitch point. In this figure is seen the straight sided rack tooth inclined at an angle of 14½ deg., with the pitch line thus making the angle between the sides of the rack tooth equal to 29 degs.

As an example of the application of the involute to the teeth of gears, let us take the case of a gear with 30 teeth of 4P and layout the tooth of both gear and a mating rack. To obtain the circular pitch from the diametral pitch P, divide 3.1416 by the pitch number thus, 3.1416 ÷ 4 = .7854 in. The pitch diameter of the gear is then found by dividing the number of teeth N, by the diametral pitch P or 30 ÷ 4 = 7.500 in. Then with the compass draw the circle with O as a centre, as in Fig. 5, and with a diameter equal to 7.5 in. Draw the pitch line (c d) of the rack tangent to the circle at the pitch point. Draw a diameter (y x) intersecting the point of tangency of the pitch circle and the pitch line of the rack at the pitch point (a). From the point, (a), lay off on the circle the distance (a a in.) equal to the circular pitch of the tooth. Bisect this, getting the point (a^1). The space (a a^1), being the thickness of the gear tooth, this distance may be spaced off on the pitch line of the rack to the left of the point (a). Through the point (a), the pressure line

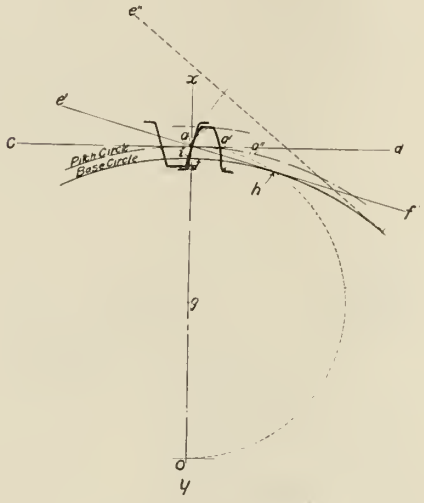

Fig. 5. Laying Out Gear Teeth.

may be drawn at an angle of 14½ degrees with the pitch line of the rack; also the base circle can be drawn tangent to this pressure line from the centre (O). The involute curve for this base circle may now be drawn as explained in connection with Fig. 2. Out from the pitch circle a distance equal to the addendum which is ¼ or .25 in., the addendum circle may be drawn from the same centre (O). The radius of course will be ¼ inch longer than the pitch radius.

The involute curve will extend to the base circle at (i) and from this point in, the tooth is made radial in shape to the point (j) a distance in from the pitch point equal to the addendum or ¼ inch. The full depth of the space below the pitch point being (y) + (f), or .368 times the circular pitch of the tooth, the root circle can be drawn with a radius this much less than that of the pitch circle. The part from (j) to the root of the tooth is composed of a fillet of a radius equal to .05 times the circular pitch of the teeth. The opposite side of the tooth may be drawn in the same manner.

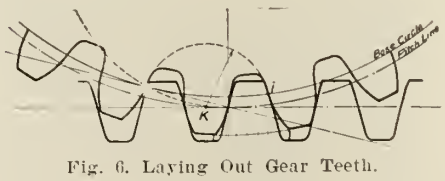

Fig. 6. Laying Out Gear Teeth.

Approximations.

In order to do away with the unnecessary labor of laying out the involute curve a close approximation has been devised for the 14½ deg. system whereby the curve can be constructed by means of the compass. With the compass set at a radius equal to one-quarter of the pitch radius and from a centre (g) on the line (y x) half-way between the points (O) and (a), draw the semi-circle connecting the points (O) and (a). This semi-circle will intersect the base circle at the point (h) which is the point of tangency of the pressure line with the base circle. From (h) as a centre, and with a radius (h a), draw the circular arc from (i) to the addendum circle which arc will coincide closely with the involute already drawn and can be used in its place in drawing the teeth. The fillet can then be drawn with a radius equal to (f), or (.1xt). The above approximation may be used for gears with teeth of more than 30 in number.

In the smaller gears with teeth as few as 20, the curve for the involute may be drawn as for those with 30 or more but the flank or that portion of the tooth below the pitch line must be obtained by different methods as it ceases to be a simple radial line. It becomes a curve closely approximated by an arc of a circle drawn from the centre (k) which is located on the pitch line in the centre of the tooth between the teeth whose flanks it forms as in Fig. (6). The radius of the arc is equal to (k i). The fillets are drawn with a radius equal to one-seventh the distance between the points of the teeth on the addenda circle (1 1).

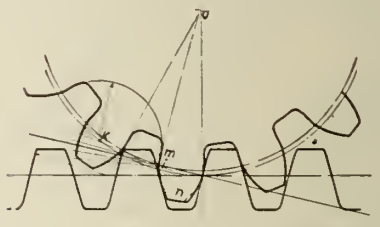

Fig. 7. Laying Out Gear Teeth.

For pinions with less than 19 teeth, the flanks are made radial for a distance in from the base circle equal to 3.5 divided by the product of the number of teeth times the diametral pitch, or 3.5 ÷ NP. With the compass set at the point (k) as a centre and a radius of (k m), draw the curved portion of the flank and fill in with the fillet as in the case of the gears with twenty teeth.

For gears with small numbers of teeth, the face of the teeth will be more pointed than should be if drawn by the approximate method above given, and in cases where extreme accuracy is required, the face should be drawn by means of a constructed involute. It is not necessary to construct an involute for each tooth. Design one tooth only and draw in the others by means of the compass set to a radius that will give the nearest approximation to the involute as constructed. The difference between the two methods is most noticeable in the case of the twelve tooth pin-

RELIEVING THE FOREMAN.

By A. E. S.

IT is notorious that very little information regarding the process and routing of the work can be got from the average blue print. In fact, the average foreman considers himself lucky if he gets blue prints that are properly and completely dimensioned. The draftsman seems to think that if the drawing is sufficiently clear to be made out by the man in charge, it has well accomplished its whole purpose.

One foreman of our acquaintance being unable to move the designer to be more explicit, has accomplished his end by making a couple of parallel slits in one edge of the tracing so as to leave a free strip narrow enough to go into a typewriter. He then dictates such directions to the stenographer as he wishes to be carried by the blue print for the operator's information. By thus making the drawings self-explanatory, he has a much larger proportion of his time to devote to profitable work.

IDENTIFYING DIFFERENT BRANDS OF TOOL STEEL.

By Peter M. Blair.

Considerable trouble was experienced by a Western Ontario manufacturing concern in distinguishing the different brands, grades and makes of bar tool steel and high-speed tool steel. They were large users of the various kinds of tool steels and carried a considerable stock on hand at all times. It, however, frequently became mixed in the storage racks, and it was then often impossible to distinguish one brand from the other.

Under the new method, a colored chart has been adopted and one furnished to each department in duplicate, this chart being made up in the same manner as the colored cards issued by paint manufacturers. Against each separate block of color is the name of the steel and brand for which that color stands.

Where the brand of steel is identified by painting merely the ends of the individual bars, the identification is frequently lost, the color not being replaced on the fresh ends. With the new arrangement, when a shipment of steel is received, each bar is painted with a colored stripe a half-inch wide, and extending the length of the bar.

When an order is sent to the steel storage department for some one definite brand of steel and the bar has to be cut the remaining piece is still identified by the full length colored stripe.

The foreman issuing the requisition in this way also sees that he receives the steel he specifies on his requisition by consulting his chart.

DEMAGNETIZING MILLING CUTTERS.

The utility of magnetic chucks in planers, shapers, grinders, and other machine tools is well known, but such holding devices have not hitherto been considered suitable for use on milling machines owing to the milling cutter becoming magnetized by stray field from the chuck and consequently becoming covered with chips which foul the cutting edges and damage the surface of the work.

To eliminate this trouble and make possible the use of magnetic chucks on all milling jobs, the Magnet-Werk firm, Eisenach, supplies an alternating current electromagnet to be mounted over the milling cutter, so that in a horizontal spindle machine the cutter runs in an arched recess below and between the poles of the magnet. On exciting this magnet by alternating current of any frequency available in practice, an alternating magnetic field is established round the milling cutter, and the latter is kept demagnetized during working.

Chips will not adhere to the cutter, but the working of the chuck, which is powerfully excited by direct current, is unaffected. Chips thrown up by the cutter or carried round with it mechanically are attracted by the alternating current magnet core and may easily be cleared from time to time from the space between the magnet and the cutter. The auxiliary magnet then prevents the cutter becoming choked by either magnetically or mechanically attached chips, and, owing to the fact that it is excited by alternating current, it is itself easily kept clean.

The form of the alternating current magnet core can be adapted to the particular type of miller concerned, and should alternating current supply be not already available, a small alternator can be driven from any convenient line shaft. This demagnetizing and chip removing device is, of course, applicable with advantage even where magnetic chucks are not used, and can be used to demagnetize tools and other steel pieces which by one means or another have become magnetized.

LUBRICATION.

By M. L. S.

ALONG with the development of the heat treatment of steel and of high rotative speeds, successful lubrication is one of the most necessary qualifications of the light, powerful machinery which is finding so many uses in the mechanical progress of to-day.

The old method of squirting oil on the shaft through a hole in the bearing at more or less irregular intervals, is not only impossible in some of the recent high-power machines, but by forming an efficient trap for the collection of dust and grit and its tendency to run out and collect on surrounding objects, makes it a positive detriment.

Three systems of lubricating high-pressure and high-speed bearings are coming more and more into use, namely, grease, forced, and flood. The grease or hard oil system is being used largely by manufacturers of domestic machinery, motors, implements, etc. It has the advantage of cleanliness and can be so introduced as to keep the bearing fairly well lubricated until the period for which the machine is guaranteed expires, after which the builder is not so directly concerned.

Force feed oiling systems are particularly valuable where even distribution is required, and this method is one of the individual factors that has made the steam turbine and high speed generator possible. It is and will be the most popular method of lubricating high-speed prime movers.

The up-to-date method of lubricating machine tools of high power is, however, the flooding system. It consists of pumping oil in a continuous stream to the higher bearings and draining from these to those lower down, and so on back to the tank, usually in the base of the machine. The attractive feature of this system is that the oil flowing completely over the bearing exercises a cooling effect as well as that of lubrication. Foreign particles are completely washed away before they can get into the bearings, the oil can be used over and over again, and the operation of the system is always under the observation of the operator.

AUTOMATIC TOOL CHECK.

A FIRM who have been experiencing trouble with loss of their workmen's tools have had racks built, designed to hold each tool used. If at closing time a single tool is missing, it is indicated automatically, without counting or checking, by its absence. Again, if occasionally a tool is being repaired, a numbered repair card is inserted in place of it, indicating where the missing tool is.

FROM GREY-DAWN TO BLUE-DUSK.

By James E. Cooley.

The difference between a man jogging along in an ox-cart in the year one, and the man spinning along in an automobile in the present day is the difference between the man who is afraid of change, and the man who goes forth daily and batters down the old to set up the new.

Far back in aeons of time you were once a scaly animalcule placidly sleeping on an alluvion shore when one day you woke up, or came to, and started forth alone. Up the elevating slopes, over hills and down dales you went, until you arrived at what you are to-day. What you are now, you have made yourself; nothing else has made you. You have not been a "child of destiny," or subject to "geological changes." You've come up the "ascending scale" by your own exertions—by your own nerve.

Because somewhere back in a distant age someone had the nerve to erect a house in the open instead of living always in a cave, and because someone had the nerve to use a dug-out log for a boat as a means of transportation, others began doing the same thing—began to use their nerve. It was these leaders and their imitators who were always in the van—always in style. Imitating is not such a disagreeable thing, for some of these imitators soon produced better houses and better boats. We've lent a hand and given each other a boost and all that sort of thing, but it's only by our own nerve, the kind that produces something, that we are advanced.

If you look at a mansion and then at a hovel, you will see that the mansion was produced by one with a bigger nerve, than the one that produced the hovel. If you see a man holding a responsible position and thoroughly interested in his work; and one ont of employment who believes he is down and out, you will see which of these has got the most nerve, and if you have your eyes open you will see that in this world productive nerve is pretty near the whole thing; and—as regards yourself—if you expect to occupy a niche in the hall of fame, or leave some trace of a worthy deed behind you, to show that you once existed, you have got to get busy and put your nerve to work.

Nerve is that mighty thing that impounds the waters of a lake and cuts a continent in two; that thing that goes in and pulls down ram-shackles, drives out disease and dirt, in the name of sanitation and health. It is the thing that is going to destroy the saloons and penitentiaries, abolish the divorce evils and re-establish homes. It is going to wipe out prostitution, take girls and women from the streets and place virtue back upon its throne. It is that thing that will yet develop a better race of men and women, turn the bad into good, and make this Earth a Paradise.

Are you going to have a part in this great drama? Going to be just an onlooker in the galleries, or are you coming down to help shift the scenery? It is in your power to bring on all these changes. It is in your power to pave the way for this better day. It is within your ability and courage to render a magnificent service, if you've only got the nerve to do it.

Up then, and do something. Up with your nerve and create something. Don't stop to read the achievements of yesterday for inspiration. Don't stop to study the heroes of the past to spur you on. Look at nothing but yourself, roll up your sleeves, buckle in and begin. Hitch up your mighty steed nerve, and with a chain to its harness pull down the rocks and boulders that for centuries have impeded the progress of man. Sit stiff upon your loyal steed, scan the horizon with your piercing eye, gather fresh energy each hour and work well, and work hard with all your might.

From grey-down to blue-dusk put your best self into your work. From grey-down to blue-dusk look straight ahead; don't ever give up. From grey-dawn to blue-dusk keep your nerve keyed up, and your soul on fire, and accomplish something useful. The world wants your achievements—your creations. It wants to place at your feet its richest and noblest gifts. It wants to pay you a glad ovation. It wants to carve your name upon its biggest shaft; name after you its children, its cities, and a newborn star, and bid you walk down the corridors of time.

REVERSING MOTOR DRIVE FOR MACHINE TOOLS.

THE subjoined data compare the power requirements and general performance of a 25 h.p. (nominal) planing machine driven by: (1) Simple belts; (2) double belts; (3) high-speed pneumatic coupling; (4) low-speed pneumatic coupling; and (5) direct coupled reversing electric motor. Direct electric driving effects 50 per cent. or more reduction in transmission losses in some cases, but in other instances the saving in this direction is much smaller. The actual power requirements during the cutting stroke are much the same whichever driving systems be used, but the slip loss is about six times as great with simple and three times as great with double belts as with pneumatic couplings or with direct electric drive.

In a particular series of tests (quoted in Werkzeugmaschinenbau) the relative power expenditure on light load was: Direct electric drive, 1.00 (assumed); low-speed pneumatic coupling, 2.3; high-speed pneumatic coupling, 4.0; simple belt drive, 4.75; double belt drive, 5.25. The cutting work performed per minute by direct electric drive was 42.2 per cent. greater than by simple belt drive. Further data comparing the several driving systems are presented in the following table:

VARIOUS SYSTEMS OF DRIVING 25 H.P. PLANING MACHINE (9 FT. STROKE).

Driving System.		1	2	3	4	5
Cutting load	H.P.	25	25	24	26	31
Full load with light reverse	H.P.	35.5	45.3	75	25	20
Full load with loaded reverse	H.P.	25.0	55	36	15	20
Light return	Secs.	7.2	7.2	7.6	6.8	5.6
Duration of cycle	Secs.	27.2	27.2	27.1	22.8	19.0
Light return speed	ft./min.	22.2	22.2	21.8	23.5	28.6
Cutting speed	ft./min.	8.0	8.0	8.2	10.0	11.9
Ratio of cutting to return speed	I:	2.78	2.78	2.57	2.35	2.40

Reversing motor drive offers similar advantages in the case of wire and tube drawing machines, boring machines, turret lathes, etc.

There is to-day no excuse for retaining couplings and stepped pulley combinations which are costly to maintain and inefficient in operation. In the case of reversing machines, rapid yet smooth reversal is effected electrically by the automatic actuation of several braking steps on a controller; such graduation cannot be attained mechanically. Cutting and reversing speeds being independent of each other where electric drive is used, any desired number of speeds can be provided, and the lowest cutting speed may be combined with the highest speed of reversal or vice versa.—Engineering Review.

K. W. Blackwell, vice-president of the Canadian Steel Foundries, Ltd., who has been visiting the Old Country, is expected home this week.

Arithmetic for the Machinist and Workshop Operative

By J. H. Rodgers

With the further development of this course in arithmetic, it will be found by those who have followed the introductory lessons and profited by them that the various practical applications resulting from the succeeding lessons will be easily observed and their time and labor-saving features so appreciated as to be adopted at every available opportunity.

MENSURATION OF SOLIDS.

IN our May 28 issue, mensuration or measurement of lines and surfaces was explained, and examples of its practical application given relative to familiar shop equipment. The measurement of solids is discussed in the present instance, well known accessories to mechanical engineering products being again the examples of its application.

A solid, or body, has three dimensions; length, breadth and thickness, and the entire surface of a solid is the area of the whole outside of the body, including the ends. The volume of a solid is the number of unit volumes it contains, as cubic inches, cubic feet, etc.

A prism is a solid whose ends are equal polygons, and parallel to each other and whose sides are parallelograms.

A cylinder is a round body of uniform diameter, with circles for its ends.

The convex surface of a right prism or cylinder is the perimeter multiplied by the height or altitude. The volume of a right prism or cylinder equals the area of the base multiplied by the height. (See Chart 20.)

A cone is a solid whose base is a circle and whose convex surface tapers uniformly to a point called the vertex. The convex area of a right pyramid or cone equals the perimeter of the base multiplied by one-half the slant height. The volume of a right pyramid or cone equals the area of the base multiplied by one-third the altitude.

If a pyramid or cone be cut by a plane parallel to the base, the lower portion is called the frustrum of a pyramid or cone. The volume of a frustrum of a pyramid is found by multiplying the sum of the areas of the upper base, the lower base, and the square root of the product of the areas of the two bases, by one-third the altitude, or by formula:

vol. $= 1/3\ h\ (A + a + \sqrt{A \times a})$,

in which h = altitude, A = area of upper base, and a = area of lower base.

Example:—What is the capacity of a tub, 14 inches high, 28 inches dimeter at the top and 20 inches diameter at bottom? Assume 7.477 gallons to the cubic foot.

By formula:

vol. $= 1/3\ h\ (A + a + \sqrt{A \times a})$.

Capacity in gallons:

$$7.477 \times \frac{1/3\ h\ (A + a + \sqrt{A \times a})}{1728}$$

$$= 7.477 \times \frac{1}{3} \times \frac{14}{1} \times \frac{1369.81}{1728}$$

$= 27.665$ gallons.

A sphere or ball is a solid bounded by a uniform curved surface, every point of which is equally distant from the centre. The area of the surface of a sphere equals the square of the diameter multiplied by 3.1416. The volume of a sphere squals the cube of the diameter multiplied by .5236 (see Chart 20).

Example:—Required the diameter of a cast iron ball to weight 12 lbs. Assume the weight of cast iron to be .26 lbs. per cubic inch.

The volume of the ball will be its weight divided by the weight of one cubic inch, or $12 \div .26 = 46.15$ cu. in.

Then by formula (chart 20) volume,

$$= .5236\ d^3 \text{ or } d = \text{cu. rt. of } \frac{46.15}{.5236}$$

= cu. rt. of 88.14 = 4.45 inches.

To find the area of a disk or washer, multiply the difference between the squares of the two diameters by .7854, or by formula (Chart 20):

$$\frac{3.1416}{4}(D^2 - d^2) = .7854\ (D^2 - d^2)$$

The volume of a hollow tube equals the area of the end multiplied by the length. Example:—What is the weight of a 9-foot length of hollow tubing, with an external diameter of 6 inches, and an internal diameter of 3.5 inches?

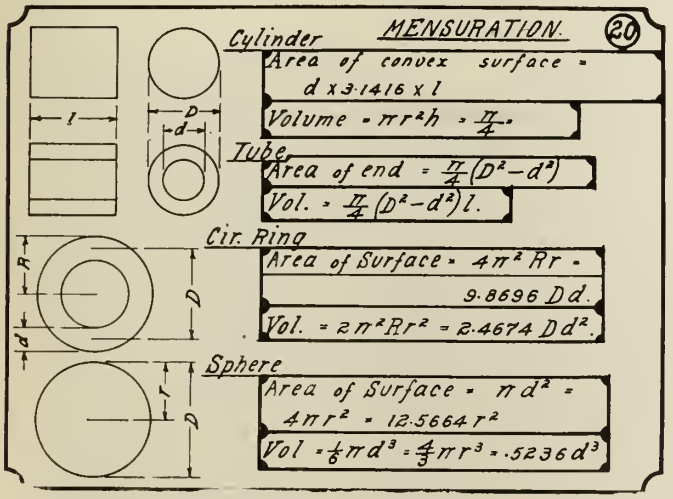
Assume the weight of the steel to be .282 lbs. per cu. inch.

By formula (Chart 20),

$$\text{Vol.} = \frac{3.1416}{4}(D^2 - d^2)\ L$$

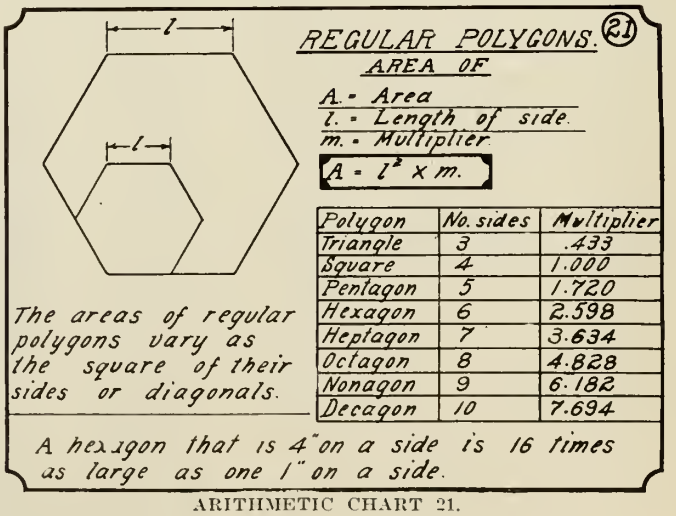
$= .7854\ (6^2 - 3.5^2)\ 9 \times 12$

$6^2 - 3.5^2 = 36 - 12.25 = 23.75$



Then weight of shaft:

$= .282 \times .785. \times 23.75 \times 9 \times 12 = 568$ lbs.



To find the area of regular polygons. Square the length of one edge, and multiply by the constant or multiplier found in (Chart 21) using the formula,

$$A = L^2 \times m.$$

Example:—What is the weight of a 12-ft. bar of hexagon steel whose edge measures 2 in.? Assume the weight of a cu. in. to be .288 lbs.

ARITHMETIC CHART 20.

Polygon	No. sides	Multiplier
Triangle	3	.433
Square	4	1.000
Pentagon	5	1.720
Hexagon	6	2.598
Heptagon	7	3.634
Octagon	8	4.828
Nonagon	9	6.182
Decagon	10	7.694

ARITHMETIC CHART 21.

By formula, $A = l^2 \times m$,

Volume = A × length of bar in inches.

Weight = .288 × volume =

$= .288 \times 2^2 \times 2.598 \times 12 \times 12 = 431$ lbs.

Knowing that the area of regular polygons vary as the square of their sides or diagonals, what would be the weight of a 12-ft. hexagon bar of similar steel whose edge measures 1¼ inches?

Let × = required weight;

$X : 431 = 1.25^2 : 2^2$, or

then

$$X = \frac{431 \times 1.25^2}{2^2} = \frac{431 \times 1.25 \times 1.25}{2 \times 2}$$

= 168 lbs.

PROPORTION IN MACHINE TOOL DESIGN.

Many inventors qualified by long practical experience to effect improvements in machine tool construction are possessed of limited theoretical knowledge and do not realize the varying influence of changes in scale on the necessary actual dimensions of machine tool parts and the forces acting or permissible thereon. On grounds of economy they construct small scale models, perfect the latter and then expect to obtain equally satisfactory results in a full-sized machine, say, five or ten times as large as in every vital part. The fallacy underlying this assumption is easily exposed by a particular example.

Suppose that a part of weight P slides on a surface S in the model. The frictional resistance per unit will be represented by u × P / S. If all dimensions be increased n times, the weight of the full-sized slider will be ($n^3 \times P$) riding on surface ($n^2 \times S$) and offering $n \times (u \cdot P / S)$ frictional resistance per unit area. The total frictional resistance equals that in the model multiplied by:— (1) n, taking account only of unit surface; (2) n^2, allowing for the fact that the total surface increases with the square of n; (3) n, to allow for the n times greater travel in given time. The total effort required, therefore, increases about sixteen times even if the dimensions of the model be only doubled.

The force applied to the slider may be F in the small scale model. In the full-sized machine, the surface being ($n^2 \times S$) the force may be ($n^2 \times F$) to preserve the same loading unit area (the materials being assumed the same in each case). Thus the applied force may be only n^2 times that in the model, whereas the frictional resistance will be n^4 times as great as in the model. Such an increase in the relative importance of frictional resistance may easily condemn the whole design. —Conserv. nat, des Arts et Metiers.

SUBSTITUTE FOR CLAY IN RE-BABBITTING.

OWING to the high speed used on buffing and polishing lathes, and the heavy wear on same, the re-babbitting of these machines is necessary. As a substitute for clay in re-babbitting bearing boxes, the following has been found very practical and economical. It sticks well, will not blow out or soften with hot metal contact, and can be used many times over by the addition of a very small quantity of oil when softening it again. It is far better than clay or putty when either is used alone.

Reduce putty with cylinder oil until it is almost as thin as the oil itself; next take some powdered asbestos pieces (old asbestos pipe covering ground up will do) and add to the putty mixture until you get a stiff compound as dense as the putty was in its first state. Use this in any way, and it will give entire satisfaction.

A WORD TO THE BOSS.

It would pay every employer and every manager to take these words of friendly counsel to heart.

If you want to improve your staff don't get on their nerves—get at their brains. The nagging boss never cures the lagging assistant, and a policy of pin-pricks punctures the soundest enthusiasm in time. You can no more henpeck a staff into doing their best than you can spank a howling child into a smiling good temper. If you're always down on a man, it's all up with his chances of doing well.

It's the irritable master that makes the sullen servant, for the more snappish you are, the less "snap" will there be on the part of your men. It doesn't pay you to have a dissatisfied staff, for you won't grind dividends out of discontent. A grumpy staff means an empty shop. Scowling faces frighten away customers.

Don't be annoyed if your men don't always share your opinions on business matters. You can't expect every one you employ to see the world through your eyes. You must make allowance for the personal point of view. You're a fool to make your men mere imitations, mere parrot echoes of yourself. Let them develop their own ideas. Make them men, not machines. If you don't make the best of your men, you'll never get the better of your rivals; and if you want a man to use his head, don't treat him merely as a "hand."

A blunt employer is apt to say some very sharp things. That's all very well on occasion; but don't be everlastingly sneering at the stupidity of your staff. A friendly pat on the back sometimes lightens a man's task more than a heavier pay envelope does, and little kindnesses do more than big money to insure a loyal staff.

Better have a loyal staff of men who make mistakes sometimes than of clever, discontented workers who simply loathe you, and don't care a tinker's curse whether the business goes down or not. Don't you think so?

WEALTH FROM MANUFACTURES.

The country that sells raw materials will always be poor, just as the farmer who sells corn, and not hogs, will never lift the mortgage. If you have a forest, and can work it up into tables, chairs, bookcases and violins, you will make a deal more money than if you sell firewood.

The United States has one-sixteenth the population of the world, but it has one-third the wealth of the world.

The North American Indians had the raw stock, but they did not know how to use it. Our wealth comes from the ability to combine coal and iron-ore; lumber and steel bolts; leather and shoestrings; paint and glue; rubber and steel. So we have supplied the world with automobiles, shoes, farm implements, locomotives, engines, brass castings, machinery and manufactured commodities in a million forms, and to-day there is being brought into America in payment for goods manufactured in the United States five thousand five hundred dollars every minute for ten hours, three hundred days in the year.—The Philistine.

LAYING OUT GEAR TEETH.

(Continued from page 576.)

ion as shown in contrast in Fig. 7, where the approximate curve is drawn in broken lines at (n).

A rack constructed with the theoretical straight tooth will interfere with the teeth of all milled mating gears with less than 30 teeth, the point of the rack tooth hooking into the flank of the mating tooth near the base line. This will happen in all cases where the tooth of the gear is constructed on the radial flank principle which is the case in all milled teeth. To overcome this to some extent, the tooth of the rack is rounded at the point as in figure (7), the radius of the arc being taken as .67 times the circular pitch, or 2.10 divided by the diametral pitch.

The above rules give teeth of form very close to that of the standard gear cutter and should not be mistaken for that of teeth produced by hobbing or other generating systems. The tooth of the generated gear is not of the radial flank type, but is purely involute in form and is based on the uncorrected straight-sided rack tooth which gives the teeth of pinions the slightly undercut form.

Machine Tools of Canadian Design and Manufacture

By M. L. Smith, B.A.Sc.

The machine tool industry of Canada, although of modest proportions relatively, represents nevertheless, in its variety products, achievement comparable with that realized in those of our most progressive manufacturers, a circumstance largely due to highly competitive conditions. This series of articles will feature the more prominent specialties of Canadian machine tool builders.

SPECIAL PUNCH AND SHEAR.

NOT a few of Canada's greatest manufacturing institutions owe their success to a pronounced ability to meet and adapt their products to particular conditions and requirements. A pointed case of this is seen in one of the latest shearing machines put on the market by the John Bertram & Sons Co., Dundas, Ont.

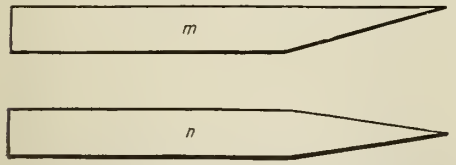


FIG. 2. DRIFT BOLT PRODUCTION.

This consists of their No. 5 single punch and shear specially arranged for the use of contractors, structural workers and for harbor and dock construction. Such services necessitated a specially flexible arrangement of machine and attachments for punching and shearing structural shapes, slitting and cutting off stocks, etc.

The attachment illustrated, is designed for the production of finished drift bolts of any size from the bar in a single progressive operation. The bar is first cut off in lengths to make two bolts as shown at (a) Fig. I. It is then sheared diagonally by the shear blade (d) producing two bolts of the form (m) Fig. 2. The points are now bent in position (b) by the die (c) Fig. I. to give the finished form of bolt illustrated at (n) Fig. 2.

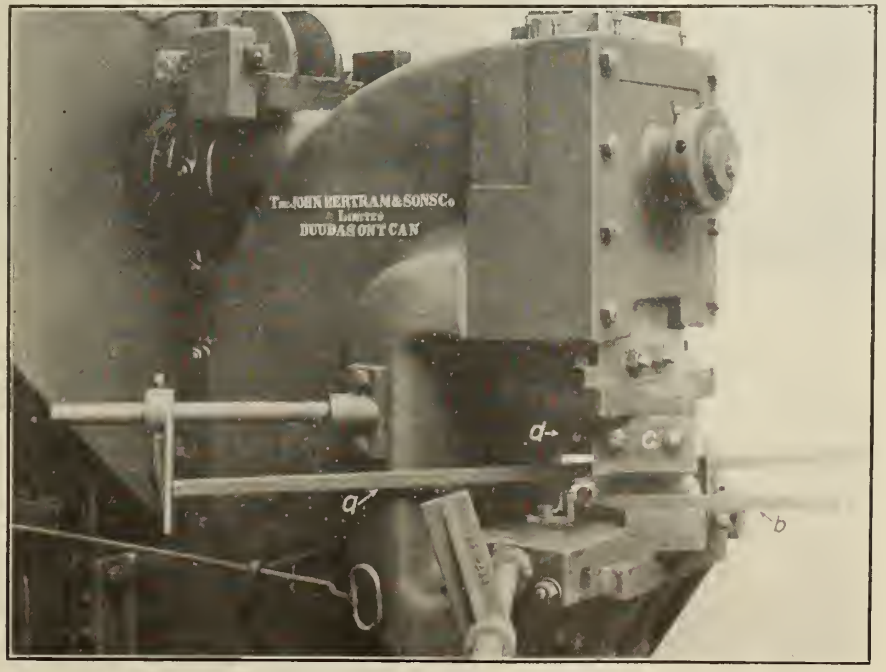

FIG. 1. SPECIAL PUNCH AND SHEAR.

Considerable difficulty was encountered in designing a satisfactory shearing die for the second operation. This, has, however, been overcome and drift bolts up to 1¼ in. square are turned out with clean straight points. All body parts of the attachment are steel castings and can be quickly interchanged for other appliances.

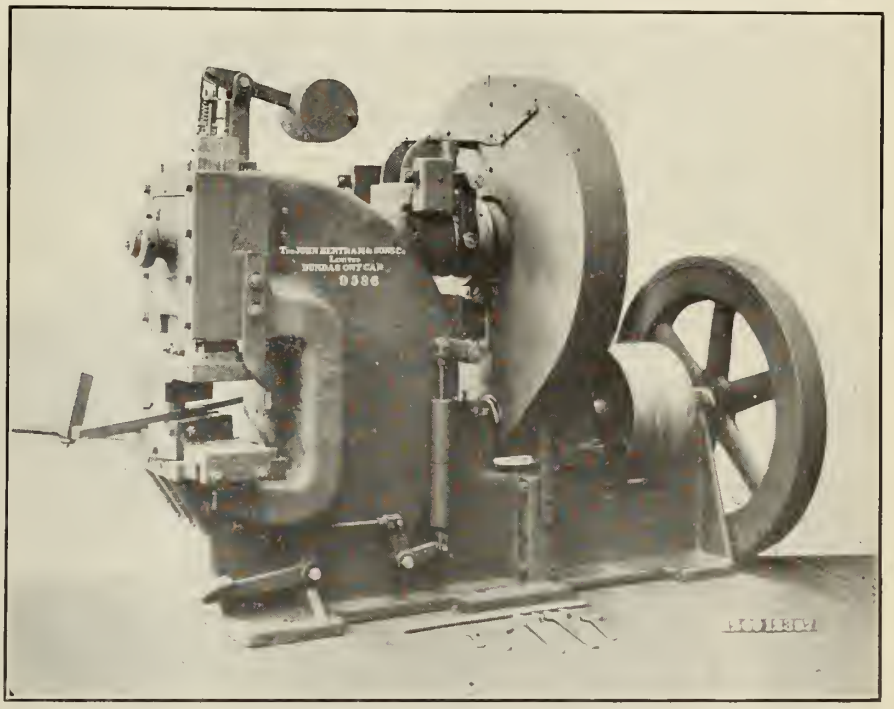

FIG. 3. SPECIAL PUNCH AND SHEAR.

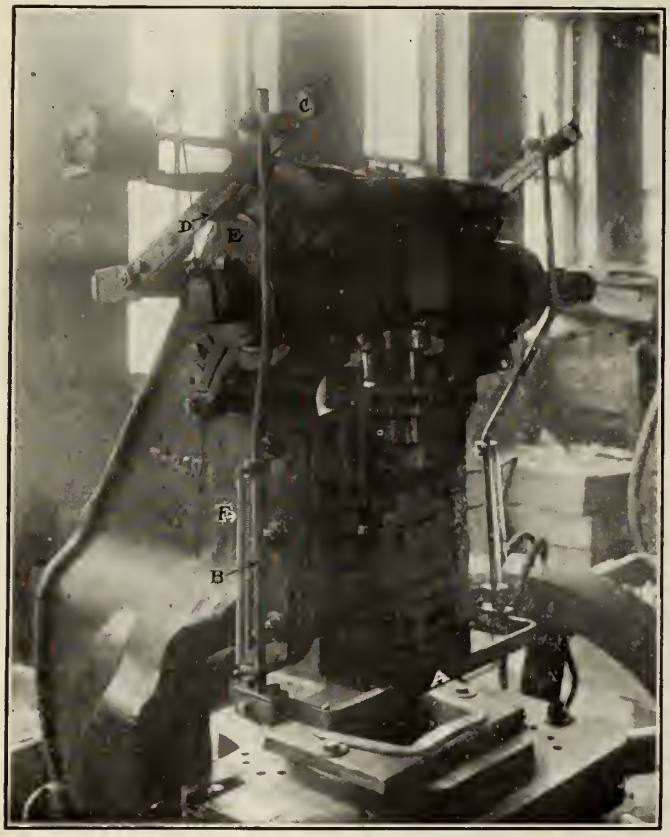
The machine complete is shown in Fig. 3. The frame is a semi-steel casting having main bearings lined with bronze bushings. The ram is also a steel casting and is provided with a suitable counter weight to facilitate hand adjustment of punches and shears. The balance weight has a heavy coil spring attached to prevent the shock of punching hard materials from breaking the weight levers. A bronze wedge gib provides for taking up all wear. The eccentric cam is also a bronze bushed steel casting and has a hardened steel shoe.

In common with the company's general practice, the gag attachment is removable for replacement by other attachments. The steel clutch has an automatic stop adjustable to any position of the ram stroke. Safety of the operatives is well looked after in that all gears and dangerous parts are complete-

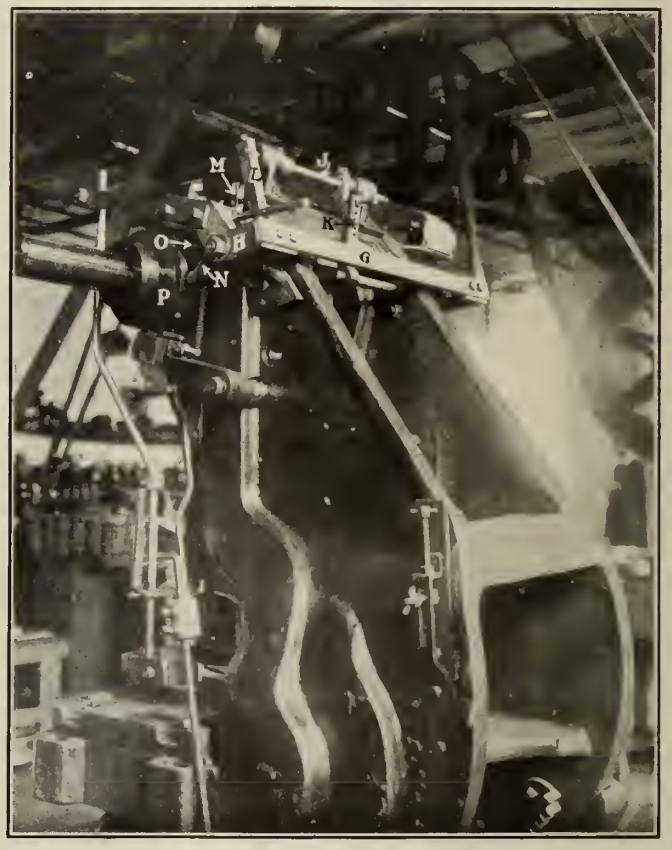
ly encased. The pilot for turning ram down for adjustment of tools has a safety ratchet which at all times, protects the workman from injury in case the lever is not removed before throwing in the clutch.

The structural jaw attachments for handling channels, I-beams, etc., are, like the spike making and other parts, made of steel castings giving a minimum of weight to these necessarily, very strong sections. The Bertram Company have recently supplied a number of these machines along with large equipments to the several new Canadian car and structural steel companies from their plant at Dundas, Ont.



SAFETY DEVICE FOR PRESSES.

THE Wright-Stacey Protection Co., Hamilton, Ont., have recently put on the market, a new safety device for attachment to power presses. The device, which is simple in construction, has been patented in Canada, the United States, England and Germany.



As will be seen from the illustrations, it consists of a guard A formed round the punch and moved by vertical rod B connected to lever C, to which is attached roller D. The cam E revolves with the driving shaft of the press, and imparts an up-and-down motion to the guard through lever C. The spring F assists in preventing any lost motion and is adjustable according to the length of stroke of the press.

When in operation, the guard travels ahead of the punch, and, as already stated, is operated by cam E, which also imparts to frame G, through lever C, a rocking motion, the frame being pivoted at H. The movement of frame G imparts a similar motion to rocking shaft J through levers K.

The lever L on end of rocking shaft, strikes the arm of lever M towards the front of press. This action causes bottom arm of lever or stop-dog N to move out in the opposite direction, and by so doing it clears clutch pin O as it comes round at each revolution of the shaft. If, however, the guard meets an obstruction, such as the operator's fingers, the motion of the punch is immediately arrested. When the guard stops, all movement in frame (G) also ceases, thus preventing levers K from moving rocking shaft J. By this means, the stop-dog is held in its normal position, that is, against hub P, and is ready to engage with clutch pin O as it comes round. The guard traveling ahead of punch reaches the die when the punch has traveled one-third of the stroke. Although frame G is moving all the time the punch is in motion, the rocking shaft and stop-dog are only operated during the last ⅛ in. drop of guard. It will readily be seen that if there were 3-16 in. between guard and die, there would be no movement in rocking shaft and therefore the stop-dog would be in position to engage clutch pin and stop the punch. The guard is adjustable to any size of punch and is held in position by a clamping device. The device is shown attached to a Brown & Boggs Co. press.

SAFETY DEVICE FOR PRESSES.

SAFETY DEVICE FOR PRESSES.

FRACTURED CRANK SHAFT.

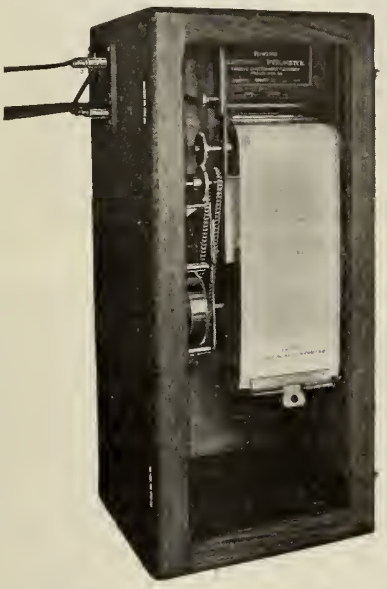
After working some considerable time, a large crank shaft fractured through an arm of the crank connected with the high-pressure cylinder. Under shock tests it showed up badly, and its microstructure indicated that it had been overheated. From the indicator diagrams and the weight of the moving parts, the stresses existing in the crank shaft were calculated. The results show that the stresses were not high enough to account for fracture, assuming that the engine had been properly assembled when new. The positions of the bearings, however, had not been happily chosen, which would give rise to greatly increased stresses after wear had taken place, e.g., a wear of 3 mm. on the end—fly-wheel—bearing would just about double the stress on the crank arm which ultimately fractured.

Ottawa, Ont.—Tenders will be received up till June 10 for the supply of certain laundry machinery, including motors and a 16 to 18 h.p. vertical boiler, to be delivered and installed at the Isolation Hospital. Plans and specifications may be obtained from T. A. Lomer, Medical Officer of Health, Ottawa, Ont.

MACHINE TOOL DEVELOPMENT

A Record of Progress Towards Higher Quality and More Economical Production in Machine, Pattern, Boiler and Blacksmith Shops, Planing Mills and Foundries

TEMPERATURE CONTROL OF OIL BURNING HEAT TREATMENT FURNACES.



A NOVEL device for automatically controlling the temperature of an oil burning annealing furnace has recently been installed by the Tioga Steel and Iron Co., Philadelphia, Pa. This company experienced considerable difficulty in successfully treating a high point carbon steel, which they were using in large quantities until they adopted the use of pyrometers. Some interesting experiments were conducted to ascertain the elongation and tensile strength of various bars of steel treated at three maximum temperatures, and a definite basis determined upon for future action.

Inasmuch as the work under way was extremely important and involved a considerable amount of money, it was decided that the dependence upon the average workman to prevent the overheating of the steel was decidedly unsafe. Therefore, it was decided to attempt to automatically control the temperature of the furnace in which the largest amount of this work was being done, the idea being to allow the furnace to gain the proper annealing temperature and allow the steel to soak for a number of hours at this temperature.

The installation consists of a Thwing recording pyrometer, manufactured by the Thwing Instrument Company, 445 North Fifth Street, Philadelphia, Pa., located in the office of the Tioga Steel and Iron Company, some 350 feet from the furnace in question, connected directly to a thermo-couple placed in the roof of the furnace, and recording temperatures every half minute upon a daily chart. Directly under the pointer of the recorder, as shown in illustration, are mounted two strips of contact metal, one strip running the entire width of the gap over which the pointer moves, the other mounted upon an insulating piece of fibre, being arranged in such a manner that it may be slid back or forth upon the first piece of contact metal.

As the pointer begins to move under the impulse generated by the thermo-couple, it assumes a position above the chart corresponding to the correct temperature of the furnace. Every half minute it is depressed upon the chart, passing through a thin film of ink, which is contained in a tapered groove near the front edge of the ink-pad. As it comes in contact with the chart, the electric contact is made by means of an automatic switch mounted on the face of the clock, which drives the drum carrying the chart. The circuit is then completed by the front section of the pointer, resting upon the lower strip of contact metal, passing through the pointer and back over the depress or frame, and out of the recorder to the relay. The pointer being insulated at half its length from the pivot on which it swings, no current is allowed to pass through the galvanometer other than the small current generated by the thermo-couple.

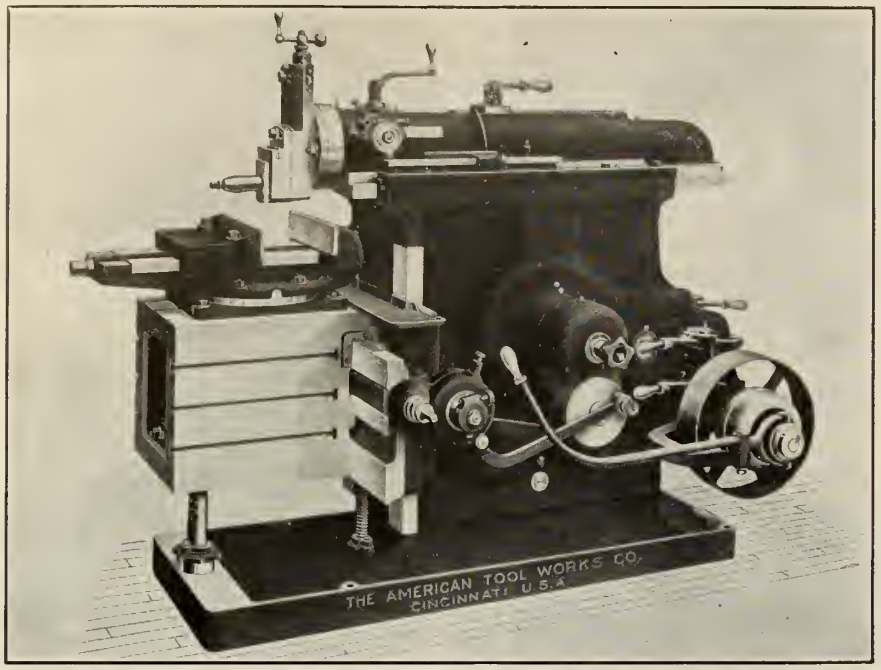
When the temperature rises sufficiently to make a depression of the pointer

THWING RECORDING PYROMETER.

upon the movable contact which has been set at the temperature at which it is desired to hold the furnace an entirely different circuit is completed. On the outside of the recorder are three binding posts—one connected to the lower contact strip, the center (or common return) connected to the depression frame, and the third to the movable contact. These are connected to a relay, designed to handle 220 volts at 0.1 ampere, mounted on the switchboard of the private power plant operated by the Tioga Steel and Iron Co.

Mounted on the oil line is an electrically-operated solenoid valve, which is connected through a relay to the three binding posts on the recorder. While the temperature is rising, the relay completes a circuit which holds the valve open, allowing the oil to flow into the furnace as soon as the temperature reaches the predetermined point, and contact is made on the movable piece of contact metal, the other side of the relay is actuated and the valve closed, shutting off the oil, and, of course, causing the temperature to fall. As soon as the lag of the furnace has been overtaken, the recorder will register this drop in temperature, when the pointer will be depressed upon the lower contact, closing the first circuit and opening the solenoid valve, again allowing oil to flow into the furnace.

By an ingenious device, it is rendered impossible for the circuit to be made more than once on either contact; i.e., when the valve is open the repeated depressions of the pointer on the lower contact have no effect and the valve will remain open until the temperature has risen to the point marked by the movable contact, when the circuit first mentioned will be broken by the relay and the second circuit made by the recorder pointer. This applies also in the matter of falling temperatures.



The control of temperature is rendered very close, depending somewhat upon the matter of the time lag of the furnace, but by averaging the increment of temperature after the oil has been shut off it is easy to control the temperature to a very close degree. This control of temperature is positive and obviates any carelessness on the part of workmen, and in addition effects a considerable saving in the consumption of oil, as the furnace is maintained at the proper temperature by the use of considerably less oil than where hand manipulation of valves is depended upon.

The indifferent attitude of the average workman toward the temperature of the furnace which he is tending is too well known to need comment among steel or iron men, and the introduction of an automatic device for regulating such temperatures is a decided step toward economy, not only in material and time, but in the item of labor, as such devices can care automatically for a number of furnaces, which would otherwise require an attendant for each.

AMERICAN HEAVY-DUTY SHAPERS.

The illustration and description refer to the essential points observed in the construction of "American" Heavy Service Shapers. The power end is designed for the heaviest work to which the machine can be applied, and consists of extra wide four-cone pulley with very high speed counter shaft and 3-in. belt, which,

with back gear, gives eight cutting speeds. All useless high or low speeds are eliminated, and the variations are kept within the working limits. The stroke can be changed at will while the machine is in motion.

NEW HEAVY SERVICE SHAPER.

The ram and rocker arm are especially designed for stiffness, the latter being rigidly connected to the shaft at the bottom. This supports all weight of arm and parts, thus removing the dead weight from the slide bearings. The ram is so connected by means of a double link that the pull is always downwards during the cutting stroke, which effectively offsets the rising tendency of the tool point.

There are thirty-two cross-feeds, ranging from .006 to .200 in. per stroke, which may be changed and set while the machine is in motion. The feed is reversed by a plunger engaging in opposite sides of a swinging gear. The mechanism is provided with a safety device in the form of a fibre friction washer, the pressure on which can be regulated to do all the work required of the feed but to slip in case of accidents or forgetfulness of the operator.

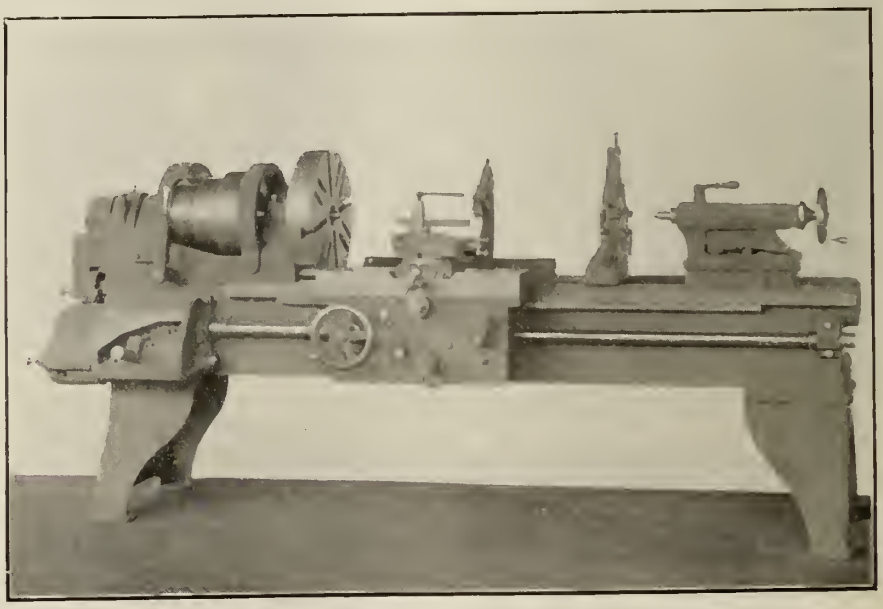
The base is large and of the pan type, with ample provision made for cleaning and draining. The tee slots in the table are cut from the solid and in directions to prevent bolts falling out when loosened. The bearings on the top, back and face of the apron are designed for maximum surface and strength and are fitted with serviceable chip guards. A stationary screw provides for the vertical adjustment of the table through a ball thrust nut, thus obviating the necessity of making a hole in the floor.

The head may be operated through any angle up to 100 deg., and the down-slide, in common with the ram-slide, is adjusted by means of a continuous taper gib in contradistinction to set screws. Large work capacity is insured by a very wide and deep vise which is graduated throughout the complete circle upon a base that covers the whole table.

Lubrication is of the gravity type, being supplied by reservoirs in connection with all bearings. Felt wipers are so placed as to filter the oil as well as to supply the proper amount to the several bearings.

The machine is the last word in shapers by the American Tool Works Co. of Cincinnati. All gears are cut from the solid by special cutters; spur and bevel pinions being cut and planed from the steel bar. All shafting is of crucible steel and ground, and the whole is set up with the constant thought of rigidity, accuracy and durability.

Regular equipments includes vise, countershaft, wrenches, safety stop and instruction book. There can also be equipped at extra cost: power down-feed, circular attachment, mold makers' vice, tilting top for box table, universal table with tilting side, gear box and single pulley electric drive.



18-INCH QUICK-CHANGE GEAR ENGINE LATHE.

The 18-inch quick-change gear engine lathe, which we here describe and illustrate, is a product of the Cincinnati Iron and Steel Co., Cincinnati, Ohio. It is claimed to be the heaviest and most powerful 18-inch engine lathe manufactured, an 18 x 8 weighing 3,500 pounds, and 170 pounds extra for each foot of bed.

The lathe will swing 19½ in., take 1⅞-in. stock, and will cut threads per inch, 2 to 46 with 38 changes of feed. Particular stress may be laid on the bearings, which are 3½ x 5¾ for front and 3 x 4½ for those at the rear. In addition, all of these lathes are built with a 3-step cone and double back gear, the back gear being proportioned 10 to 1 and 3.17 to 1.

Simplicity of design and pulling power power are features of this lathe (Cisco), only two wrenches being required for each machine. All thread and feed changes are obtained instantly without removal of a single gear and stopping the lathe, it requiring only two pull-pins and tumbler in change gear box for the operation.

The apron is worm-driven, this being

18-INCH QUICK-CHANGE GEAR LATHE.

accomplished by means of a steel worm gear and bronze worm. The apron is of double-plate type, giving back support to studs, while the half-nut lever cannot engage accidentally; and, with the non-interfering device, it is impossible to throw feed and half-nut in at the same time. Ample oiling provision is supplied and compound rest and cross-feed collars are graduated.

These machines are built in all lengths of beds from 6 feet up, and are designed for economical shop results.

MODERN ELECTRO-PLATING PLANT.

THE Canadian Hanson & Van Winkle Co., have recently installed in their Toronto works, a modern electro-plating and experimental plant for the use of their customers. The equipment is complete in every detail making it possible to give practical demonstrations in all classes of electro-plating, using the most modern methods known to-day. It has been designed and installed by W. H. King, plating expert of the Hanson & Van Winkle Co., of Newark, N.J. Electric current is supplied by a Hanson & Van Winkle generator set, the dynamo being directly connected by means of a flexible coupling to a suitable motor, with both units mounted on a sub-base. It might be said that it is of great importance to a plating installation to have in operation a motor generator set instead of having the dynamo belted from the regular shafting carrying other machinery, so that the plant can be run independently. In this instance a separate motor is employed for operating all other equipment, such as mechanical plating apparatus, polishing machinery, brush lathes, air compressors for lacquer outfit, etc.

A special feature is the use of mechanical devices for both polishing and plating, which reduce to a minimum the amount of handling of the work, thus materially reducing the cost of the operation. Mechanical plating has in recent years rapidly come to the front, which with the addition of the burnishing barrel has cut the cost enormously, and the special cleaning compounds which have been perfected in recent years for use either as electric cleaners or still solutions, have also helped to reduce the platers' troubles.

The heating of the plant has been carefully considered and has been so arranged that it can either be heated by steam from the main boiler or in case this is not in operation a special "Triumph" steam generator has been installed that can be put in service at short notice. When installing the steam fitting, great care has been taken to insulate all steam pipes in order to prevent leakage of the electric current. The installation is well worth a visit of in- Van Winkle Co. deserves congratulations for the efforts they have made to further the interests of the plating trade in Canada.

DEMONSTRATING PLANT OF THE CANADIAN HANSON & VAN WINKLE CO., Limited.

AMERICAN INSTITUTE OF METALS.

AN advance programme covering the 1914 Convention of the American Institute of Metals at Chicago, September 7-11, has been issued by the executive as follows:

Monday—Registration.

Monday Evening—Foremen's banquet, LaSalle Hotel.

Tuesday, 10 a.m.—Joint meeting with the A.F.A. Addresses of welcome.

Tuesday, 2 p.m.—Reports and A. I. M. papers. Both meetings on Tuesday to be held at the LaSalle Hotel.

Tuesday Evening—Programme open.

Wednesday, 10 a.m.—Joint meeting with A. F. A. Saddle and Sirloin Club. Cost congress. Papers and discussion.

Wednesday Noon—Ladies' luncheon at the Stockyards Inn.

Wednesday Afternoon — Stockyards inspection.

Wednesday Evening—Open.

Thursday, 10 a.m.—Saddle and Sirloin Club. Papers and discussion.

Thursday Noon — Ladies' luncheon, Marshall Field & Co.

Thursday, 2 p.m.—Papers and discussion. Election of officers.

Thursday Evening—Banquet at the LaSalle Hotel (for members only).

Friday, 10 a.m.—Last session.

EFFICIENCY IN THE OFFICE.

EVERYBODY is, at the present time talking and thinking "efficiency." How can the non-productive time of machines be eliminated? Could not that man run two machines instead of one? So much has been said and written upon this subject, it would seem that, as far as knowledge of efficient methods in the shop is concerned, we have reached a stage approaching perfection.

Much has been accomplished in cheapening machinery and manufactured products by increasing the efficiency of machines and operatives, but so far, efficiency as applied to the office staff has, for some reason or other, not been discussed.

The fact that the cost of marketing and selling certain articles is from one-third to one-half of the selling price would suggest in itself that a saving in the office end of manufacturing is something worth while. Here motion study would not only involve the manner of going about one's routine work, but could be applied to the planning of interviews, business trips and in many other ways.

By far the greatest saving in the office can be accomplished in its relations with the shop, where also a large personal element enters in. These two departments are often wasting energies on antagonistic contentions and strivings rather than conserving strength and good-will in co-operative effort. The fact should not be lost sight of that the office is part of an organization whose object is manufacturing and should accommodate itself to the attainment of that purpose.

It is in the office that a glib-tongued salesman can most easily sell an appliance for the factory that is not the best or most economical. It is here that sulphur coke is bought because it is cheap and it is there that accounts, accurate or inaccurate, invaluable or useless, are kept of cost, waste and savings. Unless efficiency and thoroughness pervade the office, the desired results of study in other departments are largely lost to the organization.

STEEL VS. MALLEABLE IRON.

WE notice throughout the manufacturing industries of this country, a decided movement towards the substitution of formed steel for malleable iron parts. This is taking place principally in connection with the production of implements and allied goods.

This form of evolution has been made possible by greatly increased and improved materials and facilities for making dies for bulldozers, drop hammers and particularly punch presses. Pressed steel is much stronger weight for weight than either cast or malleable iron and better resists almost every kind of wear except corrosion which, in most cases is preventable or unimportant.

As a large part of the raw materials in connection with the production of iron and steel is imported, the reduction of the quantity and cost of these materials is important from this point of view alone. Sheet steel, in many cases, costs a quarter less than cast iron weight for weight and is often less than half the cost of malleable. If we add to this the fact that but a fraction of the weight of formed steel is required to perform the same service, we can get some idea of the possibilities of this method of saving.

Canada is rapidly becoming a manufacturing and exporting nation and, in this connection, weight and bulk of products are often vital factors to be considered. The reduction in weight of seeding machines alone has been as much as 60 pounds and the repair parts have been reduced in a much greater proportion. The change, in most cases, has increased the strength, capacity and efficiency of the machines, and this added to the indestructible nature of the material requiring less crating, must be a considerable factor in making it possible for Canada to sell these manufactures to the rest of the world.

INDUSTRIAL NOTABILITIES--No. 38

WILLIAM ALLAN BLACK, vice-president and managing director, the Ogilvie Flour Mills Co., Ltd., Place Youville, Montreal; Mills Montreal, Winnipeg, Fort William, Medicine Hat and Seaforth; Director, Molsosn Bank; director, St. Lawrence Investment & Trust Co.; director, Home Investment and Savings Association; vice-president, Keystone Transportation Co.; managing director, Kaministiquia Power Co., Ltd., Fort William; and president, Manitoba Cold Storage Co., Winnipeg, was born at Montreal, Nov. 17, 1862, the son of Charles R. and Elizabeth (Hall) Black. The paternal ancestors were Scotch and the maternal English.

He was educated in the Public Schools of Montreal, and entered the Traffic Department of the Grand Trunk Railway, Montreal, in 1879. He transferred to the Traffic Department of the Canadian Pacific Railway Co. at Winnipeg in

WILLIAM ALLAN BLACK

1882, and joined the Ogilvie Flour Mills Co. in 1884; becoming secretary in 1887; general manager, Western Division, 1902; elected director, 1910; appointed general manager entire corporation 1911; and appointed vice-president and managing director, May, 1912. He is a member of the Grain Standard and Survey Board, and Member Council, Winnipeg Grain Exchange.

Mr. Black married Mary Campbell McEwan, daughter of Alexander McEwan, of Edinburgh, Scotland, in Portland, Me., April 29, 1890, and has two sons and two daughters.

His clubs are the Mount Royal, Montreal, Royal Montreal Golf, and Fort William (Fort William), while his chief recreation is golf.

He is Conservative in politics, Anglican in religion, and his residence is 735 Sherbrooke St. West, Montreal, Que.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, June 8, 1914.—Business in this section continues very quiet, but present prospects, although a little backward just now, point to an opening in some channels in the near future. During the past week there has been quite a lot of buying in the concrete mixer line, and also some in the machine tools; but apart from this, there has been very little doing.

It is the opinion of some of the local men that there will be a much better feeling in the business world as soon as the Government vote the Canadian Northern the money which they have asked for. At present the railway companies are doing very little buying, and, although the general movement of freight has dropped off considerably from that of a year ago, it is thought that there will be some buying after this bill goes through, notwithstanding the existing conditions.

The Phoenix Bridge and Iron Works of Montreal have just issued some figures for the eleven months ending March 31st last. These show an increase of business over the corresponding period of last year, amounting to $67,390.

The National Trust Co. have started work on their new building, which is to replace the one which they have been occupying for some time past. At the present time there is quite a lot of work under way, both down-town and in the residential districts.

Metals.

There is still a continued weakness in the metal market, and prices remain the same as last week. It is thought in local circles that the price of pig iron has reached the bottom, it being even claimed by some that the present price has been agreed upon. There is a tendency to figure out now just what future requirements will be, and a number of firms are buying, or at least intend to buy their supply of pig for the remaining six months of the year. Up to the present there has been a steady demand, although in very small quantities; just sufficient to last about a month at a time. There is still a weak feeling in tin, and although there has not been any change in the quotation, the market continues dull.

Toronto, June 9, 1914.—Business conditions have not changed materially since our last report, and trade generally seems to have fallen into a groove. The favorable crop conditions should, however, have a stimulating effect and create a more optimistic spirit throughout the country. The period of depression through which the Dominion is passing will inaugurate an era of economy which will ultimately be beneficial to trade generally, and also to the individual. This era must precede a return to prosperous conditions. A period of industrial depression frequently compels many companies which are over-capitalized to pay the penalty, and in not a few cases reorganization is the result. This is beneficial rather than otherwise, for it eliminates the unsound concerns, improves the general tone of business and restores credit.

The C. N. R. deal is making satisfactory progress, and it is considered highly probable that the G. T. P. will obtain a bond guarantee for $16,000,000 for the completion of the mountain section of the road. When these outstanding questions are settled, the railways involved will no doubt come into the market for material. The report of the Ontario Railway Board on the Toronto Street Railway is out, and contains many important recommendations which, if they ever go into effect, will improve greatly transportation conditions in the city. Incidentally an expenditure of about $3,000,000 is involved. The city council have decided to submit to the ratepayers a by-law to raise $300,000 to purchase motor busses, to serve the outlying districts. The by-law will probably be voted on in July, and if carried will considerably improve transportation facilities in certain districts.

Steel Market.

Conditions generally in the steel market are unchanged; the little business that is being done shows no improvement. One feature, however, must not be forgotten. This condition cannot keep up indefinitely, and the longer it continues the greater will be the reaction. Anticipation of a business revival in the fall is becoming a factor in the situation, and will have an effect in improving the tone of the market. Reports from Sidney, N.S., are not bright. It is stated that the Dominion Steel Corporation have closed down their nail mill indefinitely, also the rod and bar mill, which will probably remain inactive for some time. It is also reported that the wire mill will close down shortly, and remain so for over a month. The official reason given is that the company is overstocked. The United States Steel Corporation orders at the end of May showed another heavy falling-off, which has been estimated at between 300,000 and 400,000 tons, or practically equal to that of April. Prices on plates, bars and shapes have weakened slightly on special specifications, but business promises to be better this month than in May.

Pig Iron.

Market conditions in pig iron are still very quiet, and will continue so until trade improves. Comparatively little cast iron pipe is being purchased; municipalities, like manufacturing concerns, are waiting for better times. Stocks are low, and when trade improves there is bound to be a big demand for pig iron. In the United States the number of furnaces in operation was reduced by 14 in

May. The decrease in production was due largely to the lessened activity of the steel works. A still further reduction in output is expected this month.

Machine Tools.

Business in machine tools is dull and shows little hope of a revival in the near future. It is reasonable to suppose that an improvement in this market will not be noticeable until business conditions generally show greater activity. Dealers are expecting the C. N. R. to be in the market for machine tools when the agreement with the Government is settled. The Michigan Central Railway have purchased a number of tools from a local dealer for their shops at St. Thomas, Ont.

Metals.

The general condition of the metal market shows an improvement, and a larger volume of business is passing, although orders are generally in small lots. Prices remain unchanged.

Ottawa, June 8, 1914.—Unless something unexpected turns up—and it is not improbable—this week will see the close of the session. It has not been a spectacular session of Parliament; the ordinary man would say it has been a more or less useless session. There has however been passed a great deal of useful and important lgislation.

It has been pre-eminently a railway session, the most conspicuous measure being the C.N.R. bill. Then there was the G. T.P. bill, which provides for a guarantee of $16,000,000 for the completion of the mountain section. The National Transcontinental Commission report was discussed a week, while Maritime members talked themselves hoarse on the Intercolonial Railway. There was also a debate on the Hudson Bay Railway, and to cap all, the new consolidated Railway Act was introduced. This, however, will be held over until next year. Altogether, railway matters were very much to the fore.

It has been an exceedingly important session from the standpoint of the business world, amongst the bills of special importance to commercial interests being the following:—

(1) Trust Companies' Act.
(2) Loan Companies' Act.
(3) Amendment to Criminal Code (Bill to prevent false real estate advertising).
(4) Bill to prohibit the use of white phosphorus in manufacture of matches.
(5) Tariff Bill.
(6) Bill to regulate the use of explosives.
(7) Amendment to Companies' Act.
(8) Bill to regulate cold storage firms.
(9) Bill to prevent adulteration of dairy products.
(10) Consolidation of Fishing Act.

These were the main measures and it is a pretty formidable array.

Next session promises to be equally as interesting from the standpoint of business interests. The bill to consolidate the Railway Act will see a big fight between rival interests in the railway committee.

The bill to amend the Insurance Act introduced this session goes over until next session, as does the Co-operative Credit bill, introduced by Hon. Arthur Meighen.

The bill to consolidate the Shipping Act, and the bill to amend and revise the Industrial Disputes Act, will also be taken up next session. The latter is a particularly important measure and of extreme importance to industrial interests.

Winnipeg, Man., June 6, 1914.—While business actually done in ironworking machine tools is almost nil, there is a fair demand for woodworking machinery. The John Arbuthnot Co., a large Winnipeg lumber firm, whose planing mill was burned during last winter, have rebuilt their plant, and equipped it with machinery, costing in the neighborhood of $200,000. Some second-hand machinery was installed. The new machines include a moulder, tenoner, mortiser, rip saw, buzz planer, etc. The order was divided between the Canadian Fairbanks-Morse Co. and the Stuart Machine Co. The latter company sold one or two boilers this week for buildings going up in the city, but little is doing in contractors' or machinists' supplies.

Building Permits.

The city has been compelled to put its foot down on the unusual publicity being given to building permits in Winnipeg. These have been soaring at a record rate towards the ten-million-dollar mark, and the city newspapers have been drawing attention to this fact with large headlines. Their intention evidently was to prove that industrially Winnipeg was ahead of other cities in building. As a matter of fact, it is pretty well understood that only a small fraction of the buildings for which permits have been secured are being erected. The result of all this publicity was to bring into the city an army of builders, carpenters, painters, plumbers, as well as unskilled laborers, many of whom eventually joined the ranks of the unemployed. By suppressing news regarding the building permits issued it is hoped to check this influx.

It is understood that H. Corse, machinist, who for many years kept the linotypes of the city papers in repair, is branching out into a more general business, and is in the market for a drill press, a gap lathe, and a power hack saw. He has moved his plant from Alexander street to larger premises on Ross avenue.

Metals.

W. C. Cox, the Winnipeg manager of A. C. Leslie, dealers in sheets and metals, Montreal, has just returned from a five weeks' trip to the coast, and reports a demand all over the West for better tinplate. He states that hitherto tinsmiths have been handed out anything that the jobbers had to offer, which was often of a very inferior quality. He found business poor as far as the Rockies and at Vancouver, but reports excellent conditions at both Victoria and Edmonton. Government work being in progress at the former city, and much railway work at the latter.

The Manitoba Bridge and Iron Works have the contract for the steel work on the new Parliament Buildings, but it is understood they are only fabricating the steel, the erecting being done by Thomas Kelly & Sons. The plant of the Dominion Bridge Co. is slack, some of the jobs having been sent East to keep the plant there going.

E. B. Plewes, a well-known agent for machine tools and supplies, says things have been slightly better since the beginning of the month. He expects to do considerable business in belting next month, as the retailers usually get in their supplies for threshers during July.

The Medicine Hat Pump and Brass Co., Medicine Hat, Alta., who increased their capital recently from $50,000 to $75,000, are contemplating making an addition to their plant, and will be in the market for new equipment. It is reported that they are contemplating manufacturing windmills.

The Alberta Foundry and Machine Co., Medicine Hat, Alta., recently built a sample threshing machine, and may start manufacturing them shortly on a large scale.

To give an idea of the condition of some manufacturing plants in the West, the case might be cited of a Winnipeg firm who set out eight months ago to manufacture dies for jewelers principally, and who are now endeavoring to dispose of their tools second-hand. Winnipeg is not ripe, even in the best of times, for this class of business, and it is not surprising to find this firm unable to find work to keep this machinery going.

Dudley Michel, of South Wellington, Vancouver Island, formerly of the Crow's Nest district, has been appointed instructor in "first aid to the injured" for the British Columbia Department of Mines, and in that capacity will visit both metal and coal mines and give demonstrations of and instruction in first aid work, following the course of the St. John Ambulance Association.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Sydney, N. S. — A pump and electric motor will be purchased for the waterworks.

Alvinston, Ont.—The Morwood Machine shop has been purchased by Mr. Patterson.

The Natal Light and Power Co. has been incorporated in Victoria, B.C., with a capital of $25,000.

Regina, Sask.—The Canada Metal & Steel Range Co., of Oshawa, Ont., will open a branch here for the sale of their product.

The British Columbia Waterworks Supplies, Ltd., has been incorporated in Victoria, B.C., with a capital of $25,000. Head office at Vancouver, B.C.

Fort William, Ont. — It is expected that the National Tube Works will begin operations in about two weeks. A satisfactory trial was made last week.

Kerrobert, Sask.—Ross & Hayne, of Regina, have decided not to go ahead with the scheme for building a plant here for making gasoline and electric lamps.

Electrical

Wallaceburg, Ont.—A by-law has been carried to purchase the electric light plant at a cost of $30,000 and establish a hydro system. The vote was 303 for, 13 against.

Windsor, Ont.—Niagara power will be delivered here by August 1. All the towers are placed, and installing of equipment is being rushed all along the line.

Brantford, Ont.—The Hydro-Electric Power Commission has been asked for a survey of a hydro radial from Tillsonburg to this town.

Tavistock, Ont.—The by-law for installing hydro-electric power was carried on June 5 by a majority of 112 votes, 150 votes being polled.

Bolton, Ont.—The council have appointed a committee to negotiate the purchase of the Bolton Light, Heat and Power plant. When the necessary arrangements have been completed, a by-law will be submitted to the ratepayers for their sanction to contract for a supply of Hydro-Electric power.

Brantford, Ont. — A hydro-electric radial from Tillsonburg to Brantford is the latest development in railway circles in connection with this city. Working in with the Township of South Norwich, Clerk J. A. Smith, of the Brantford Township Council has written to the Ontario Hydro-Electric Commission, asking for a survey of a hydro-electric radial from Tillsonburg to Springford, to Otterville, to Bookton, to Kelvin, to Scotland, to Oakland, to Brantford.

Municipal

Victoria, B.C.—The city council have decided to purchase a paving plant from Warren Bros.

Port Alberni, B.C.—The town council are considering the question of spending $10,000 on extensions to the electric lighting plant.

Portage La Prairie, Man.—It is proposed to build a stand pipe with a capacity of $300,000 gallons. The cost is estimated at $15,000.

Cardston, Alta. — A by-law will be voted on by the ratepayers on June 15, to sanction the expenditure of $11,000 on a gravity system of water supply.

New Toronto, Ont.—Council on June 1, passed a by-law to provide for the issue of general debentures for $27,000 to construct waterworks and purification plant. James Loudon & Hertzberg, Toronto, are the engineers.

Hanover, Ont.—By a majority of 85 a by-law to authorize extension of the town waterworks system, the purchase of a site and the erection of a water tower, carried here on June 1. The expenditure involved is $10,000.

Wallaceburg, Ont.—George B. Moore, of Weston, has been awarded the contract for the installation of a water works and sewerage system for this town. Both systems are being laid together. The town will receive its supply of water from a branch of the Sydenham River.

Lloydminster, Alta.—At a ratepayers' meeting held recently it was resolved to petition the town council to proceed at once with the $15,000 fire protection scheme, cement sidewalks in business area, and to sink a deep well at once with a view to obtaining a supply for a complete waterworks system.

Brampton, Ont.—At the meeting of the town council held on June 2, the tender of the Northern Electric Co., for $3,139 for the installation of an electric fire alarm system for the town was accepted. The switchboard will be placed in the present fire hall and a tapper in the fire chief's office and also in the Dale Estate offices.

Point Grey, B.C.—A by-law to authorize the Richmond Council to raise $40,000 for the extension of the municipal water service to the outlying districts is at present being prepared, and is expected to come before the council for consideration at the next regular meeting. The by-law will probably be submitted to the electors this month.

Peterborough, Ont.—The matter of the local disposal plant being erected in Otonabee Township is being held up pending a report which the provincial board of health is preparing regarding the location of the plant. The report will be submitted to the township, for which E. A. Peck is acting, after which the township will be permitted to offer its objections to the locating of the plant on township land.

Toronto, Ont.—The tender of the John ver Mehr Co., of this city, to construct a Ransome drifting sand filter of 60,000,000 gallons a day capacity at the Island, has been accepted by the city council, with a vote of 15 to 1, on June 9. The filtration plant is to cost $1,066,282, and is guaranteed with a cash bond of $250,000 to produce tasteless, colorless water, 98 per cent. bacteriologically pure, and to require not more than one grain of chemical per gallon for the treatment.

Calgary, Alta.—The aldermen have decided to re-submit several of the by-laws which were defeated by the ratepayers in April and, in addition, a new bylaw making a grant of $360,000 to the Exhibition Company, for the erection of new buildings, improvement of grounds, etc. The bylaws to be resubmitted are as follows:—Parks, $50,000; electric light, $300,000; concrete sub-base for street railway, $90,000; publicity and receptions, $17,000. The total expenditure asked to be authorized is $807,000 and the five bylaws will go to the people on June 26 next.

Winnipeg, Man. — Seventy-four in favor and twelve against was the outcome of the voting in the rural municipality of Fort Garry on the bylaw authorizing the raising of $40,000 to provide for the construction of a distribution plant for a supply of electricity. A contract for obtaining the current has already been made with the Winnipeg Electric Railway Co., but the agreement was, however, conditional upon the passing of the bylaw. The council are now in a position to give the bylaw its third reading and proceed with the work.

Owen Sound, Ont.—By a majority of nearly five hundred, the by-law to grant the bonus of $10,000 yearly for twenty years for the construction of a shipyard and drydock was carried last Saturday by the ratepayers. An expenditure of $1,500,000 has been granted. Almost every available vote was polled. The by-law to guarantee the bonds of the Union Cement Co. was carried by some 200 votes. The bonds will be guaranteed to the extent of $60,000. Nearly four hundred votes carried the by-law giving the Canadian Yeast Co. exemption from taxation and supplying water for their use.

Toronto, Ont.—A by-law asking for permission to spend $300,000 on motor buses will be submitted to the people during the second week in July. This was decided at a private meeting of the Board of Control on June 4. Council will probably be asked to give two readings to the bill at the meeting to be held on June 15. It was decided that 35 buses will be required to satisfy the needs of the residents in North and West Toronto, but an initial purchase of ten will be made. English and American firms will enter the competition for supplying the vehicles.

General Industrial

Thorold, Ont.—Mr. Jas. Battle turned the first sod at Thorold on June 8, for the new Exolon factory about to be erected.

Kingston, Ont.—At the annual meeting of the North American Smelting Co. J. B. Reid, of Alexandria Bay, was re-elected president; W. G. Craig, vice-president, and S. J. Driver, secretary-treasurer.

Hagersville, Ont. — The mill and bakery owned by R. J. Rank were destroyed by fire on June 3. The damage to the mill is estimated at $25,000 and to the bakery $5,000. Both were covered by insurance.

Chatham, Ont.—The Board of Health has decided to purchase a pulmotor for the city. This decision was reached after a special committee had thoroughly investigated the question and members of the board had seen several demonstrations. The machine will be placed in the fire hall, which is centrally located, and opened at all times. The members of the department will be instructed in its operation.

Listowel, Ont.—The local ratepayers were to have voted on May 30, on a by-law authorizing a loan of $10,000 to the Dominion Milk Flour Manufacturing Co. The promoters, however, at the eleventh hour had the by-law withdrawn, fearing its defeat, as the town was favorable to a counter-proposal, that of the Libby, McNeil Co., of Chicago, who offered to locate a big condensed milk factory here if the town would provide interswitching facilities between the Canadian Pacific and Grand Trunk Railways. As this has been arranged, the Chicago firm will probably locate here.

Galt, Ont.—A carload of machinery consisting of boiler, drills, cables, derricks, etc., has arrived and will be used in drilling for oil on Alex. Neubauer's farm in Puslinch, near here. If the venture meets with success there are other farms similarly situated upon which wells will be sunk. These farms give every evidence of oil, and experts who have looked over the ground are very hopeful of the venture. In places on Mr. Neubauer's and John Eckert's farms the oil is to be found in small quantities floating on the surface of the water.

Montreal, Que.—Plans have been already completed and construction will start in a few weeks on an additional plant for the Jas. Strachan Bakery. The cost of building and equipping the new bakery will run into almost a quarter of a million dollars and when completed it is claimed the bakery will be the most modern in Canada. The ovens are now being made by Jos. Baker & Sons, of London, England. All of these are traveling ovens of the most improved design and when installed are entirely encased with white enamel tiling. The largest of these ovens is over 90 feet in length and 15 feet wide.

Fort William, Ont.—A rumor has been circulating for some time past here that the well known Armour Grain Co., of Chicago, were considering the installation of an office and perhaps a new elevator at the head of the great lakes. The company, which is one of the largest in the States, opened an office in Winnipeg recently, and it is regarded as almost certain that an office will be established here in the near future. A member of a well known local grain firm stated that in his opinion, the Armour Grain Company would have an office and very probably an elevator in Fort William inside of a year's time.

Regina, Sask.—The city council has sanctioned the sale of the civic warehouse to the Canadian International Light Co. for $22,000. As a result of this action the city secures a new industry which will employ at least 26 men the first year, and gets rid of a building which has been more or less of a white elephant even since its construction. The Canadian International Light Co. will be incorporated with a capital of $150,000, a substantial proportion of which is being subscribed by prominent local men. A plant valued at $30,000 is being brought from Chicago and will be installed at the earliest possible date. The company will manufacture kerosene, gasoline and coal oil lamps and smoothing irons. Ross and Haynes are interested.

Railways—Bridges

Dunnville, Ont.—The ratepayers carried a by-law to raise $35,000 to purchase a right-of-way for the extension of the T. H. and B. Railway.

Gananoque, Ont.—A by-law will be voted on by the ratepayers on June 12, to authorize the payment of a bonus of $25,000 to the Gananoque & Arnprior Railway Co. for the construction of certain lines.

London, Ont. — Announcement has been made that the London Street Railway have decided to purchase from five to ten new cars for the local service. The purchase is left in the hands of Manager C. B. King, Vice-president T. H. Smallman and Director W. M. Spencer.

Brampton, Ont.—If the G.T.R. fail to inaugurate proper suburban service to Toronto, the citizens of Brampton intend to build a 12-mile road of their own to Islington, where connections can be had with the C.P.R. The latter road have promised to operate the new line and hand over to the citizens forty per cent. of the receipts. The present C.P.R. line between Toronto and Brampton is too long for a suburban service.

Eganville, Ont.—The old bridge at the foot of Golden Lake on the Bonnechere river, eleven miles west of here, is being removed preparatory to the erection of a new one at the same point. The new structure will be of concrete and steel and will cost in the neighborhood of $6,000 or $7,000. The County will pay $1,000 towards the erection of the new bridge, the Dominion Government, $1,000 and the remainder of the cost will be paid by the Provincial Government.

wires in a transformer house. One of the safety bulletins issued by the general committee calls for the use of rubber or wood slat mats in front of and behind every switchboard, and one of

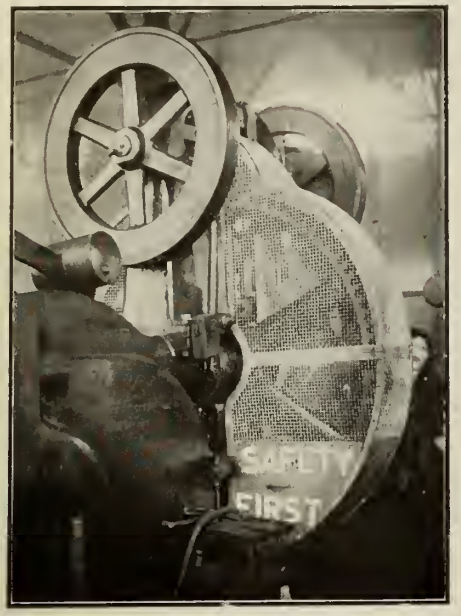

FIG. 11. GEAR GUARD ON DOUBLE-ENDED PUNCH AND SHEAR.

these wood slat foot-boards is seen in Fig 5. It is made from pitch pine and is fastened together with wooden pegs in place of nails; to eliminate all possibility of shock to the operator.

Electricians signs reading have orders to conspicuous po machine the el which may nee

Guarding Machinery.

Probably no machine in a planing mill is responsible for a greater number of lost fingers than the buzz planer, though

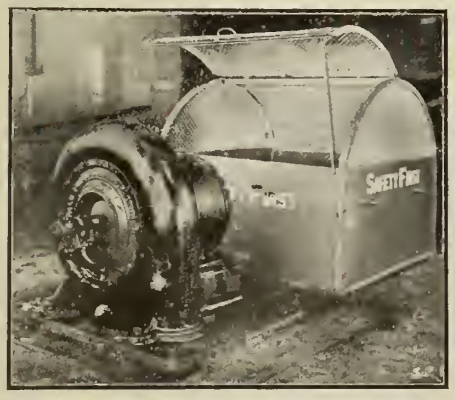

FIG. 12. COVER FOR MOTOR-DRIVEN FAN.

the band saw perhaps runs it a close second. Fig. 7 shows a small piece of stock being planed in a buzz planer. The knives are exposed throughout their full length and the operator's right sleeve is actually touching the table, and may easily be caught by the knives. Fig. 8 shows how the operation is performed in the shops of the Canadian Car & Foundry Co. An adjustable guard covers up that part of the knives not required and short, thin stock is pushed forward by a hand block somewhat similar in appearance to a hand plane. The notice board back of the machine reads:

Portion of knives not in use to be kept covered. No one al-

PROTECTION FIRST

If you want guards that will afford real protection on those dangerous machines of yours, guards that will eliminate the danger of damage suits, we're the people to do the job. The guards illustrated in the surrounding article from Canadian Machinery are good examples of this class of work. They show the protection guards afford. We would be pleased to figure with you for similar equipment for your shop.

Perhaps you need other safety first equipment. Here are a few reminders. We would be glad to quote on any of them for your plant.

Machine Guards — Machine Screens
Iron Stairs — Fire Escapes
Tool-room Partitions — Steel Window Sash

Dennis Wire & Iron Works Co.
LONDON, CANADA Limited

the gears—see Fig. 12. This type of guard could be made lighter if it were entirely of netting, but the solid lower half adds to the appearance, keeps dirt kicked up from the floor from entering the motor and gears, and greatly adds to the solidity of the whole.

From the neat appearance and high finish of the protective devices illustrated, the reader might infer that they are made up from carefully dimensioned blue prints sent out from the drafting office, but such is not the case. They are made up in the shop from measurements taken from the machine to be guarded. A few men were trained in this work in the plants and They were then other plants to en in each, who to this feature. is to sketch it As may be seen from the illustration, all guards are fitted with substantial

FIG. 14. GUARD FOR ENCLOSING GEARS OF BOLT CUTTER OR SIMILAR MACHINE.

handles by which they can be removed by three or four men, or by the shop crane, when repairs to the machine have to be effected.

Calgary, Alta.—The bylaw for erecting a $165,000 concrete bridge over the Bow river at Ninth Street West, instead of the $60,000 steel structure authorized at the last election, was passed through its preliminary stage and referred to the finance committee to fix a date at which it should be submitted to the ratepayers.

Vancouver, B.C.—A steel span is to be placed on the Kitsilano bridge of the B.C. Electric Railway Co., instead of the present wooden one south of the drawbridge. The contract has been let to J. Coughlan & Sons, for the work. The span is 125 feet long and will weigh 100 tons. The fabrication will start immediately and will be finished in two or three months. The local firm was successful in under-bidding all outside competitors, except a United States firm.

Toronto, Ont.—Contracts for two new concrete and steel bridges on the Ontario-York Town Line were let at a joint meeting of the commissioners of both counties at Whitby recently. The Standard Steel Construction Co., of Welland, secured the contract for construction of the superstructure of both bridges. The figure was $1,235. The contract for the concrete work was awarded to McDougall & Toole for $2,650. The bridges, which are each 40 feet in length, span the Jersey Creek near Brown's Hill.

Ottawa, Ont.—A little clause in the Quebec and Labrador ("All Red") Railway Bill caused its death in the Railway Committee on May 27. A Senate amendment declaring the bill "For the general advantage of Canada" was under discussion when it was discovered that there was a clause in the bill as passed by both Houses referring to the boundary between Labrador and Quebec. the Act might prejudice the boundary or that Newfoundland has any rights there and to accidentally admit it in the Act might prejudice the boundary case in the Privy Council. The bill was rejected.

Victoria, B.C.—The Provincial Executive, at a meeting held recently, opened tenders for the construction of the substructure of the new steel bridge across the Pitt River to connect the municipality of Coquitlam with Pitt Meadows. The successful tenderers were Armstrong Morrison & Co., of Vancouver. The total cost of the bridge will be about $500,000, and the work will be completed within twelve months. The bridge will consist of seven open dredging caisson piers and two pile-bearing piers. The approach on the west end will be 300 feet long and on the east end, 465 feet.

Contracts Awarded

Fort William, Ont.—The contract for the erection of the substation at the new pump house, has been awarded to the Oliver-Edwards Co., at $10,074.70.

Ottawa, Ont. — A contract has been awarded to the Canadian General Electric Co., Ltd., for transformers, switchboards, etc.

New Westminster, B.C.—William Hayman & Co. have been awarded the contract for the erection of the new St. Mungo cold storage and cannery building at $13,000.

Calgary, Alta.—The Dominion Government have awarded a contract to Janse Bros., for the building of the new elevator here. The elevator will have a capacity of 2,500,000 bushels and will cost $750,000.

Regina, Sask.—Contracts have been awarded as follows: cast-iron pipe, Canada Iron Corporation, $60,165; lead pipe, Jenkins & Hardy, $6,100; galvanized iron pipe and jute rope, Metals, Ltd., $946.40; pig lead, J. H. Ashdown Co., Ltd., $6,986; gate valves and hydrants, Drummond, McCall & Co., $8,204; 2-inch brass gate valves, Metals, Ltd., $110; brass goods, Mueller Mfg. Co., $4,040.

Winnipeg, Man.—The contract for the economizer and induced draft plant for the power house of the new law court building has been awarded to J. A. McTaggart & Co., at the sum of $23,000. This firm was also successful in securing the contract for the ventilating apparatus of the law courts building, they representing the B. F. Sturtevant Co. of Galt, Ont., and manufacturing in Winnipeg, the Acme air washers which are being installed.

Wallaceburg, Ont. — The following contracts have been awarded in connection with the waterworks system: Pump house, McGregor & Rankin; water tower and foundation, Hunter Bridge & Boiler Co.; cast-iron pipe, National Ironworks; fire hydrants, Canadian Allis-Chalmers, Ltd.; valves, Drummond, McCall Co.; water filters, American Water Softener Co.; pumping machinery, Canadian Fairbanks Morse Co.; intake and basin, A. Thrasher Contracting Co.

Montreal, Que. — The contract has been awarded to the Mannesmann Tube Co., of Montreal, for the supply of steel and cast-iron pipe and specials for Swift Current at a cost of $7,566.75; for hydrants, gate valves and boxes, to Rensselaer Valve Co., of Troy, N.Y., at $1,741.25; for sewer and water construction, to M. S. Holmes, Souris, Man., at $32,101.48; for sewer pipe and specials, to Vitrified Clays Co., Calgary, Alta., at $7,535.37.

Victoria, B.C.—The City Council has approved of a report from the electric lighting committee and awarded a contract to the Canadian General Electric Co. of Toronto for two primary and one secondary transformer, at a total cost of $520.

Building Notes

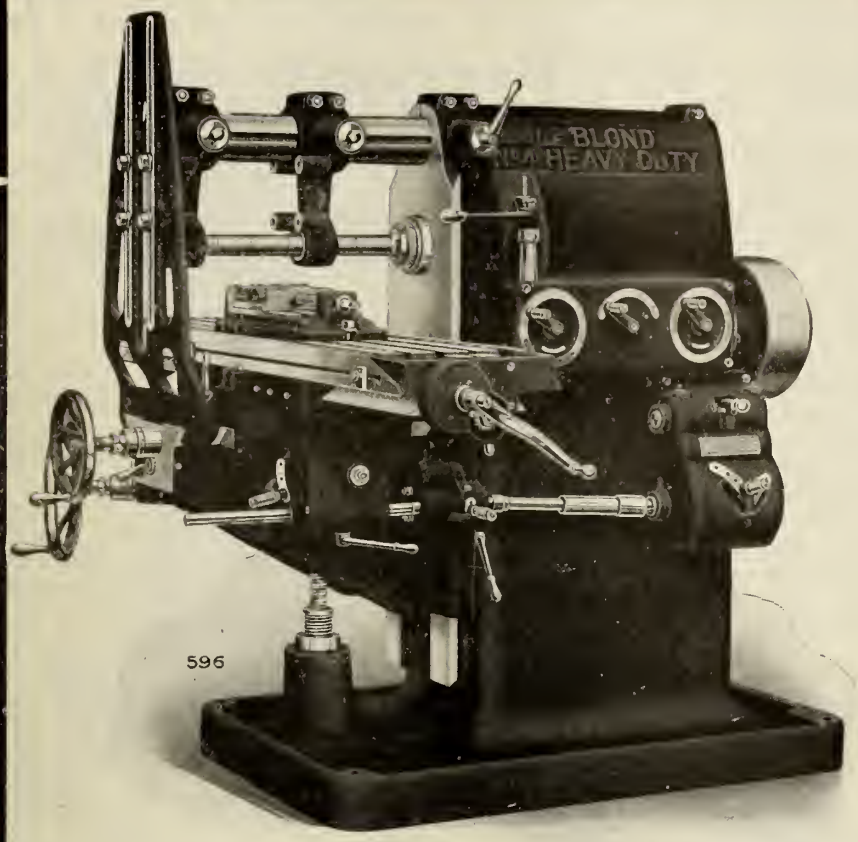
Toronto, Ont.—It is rumored that the Adams Furniture Co. will erect a new building on Yonge St., to cost about $300,000.

Toronto, Ont.—Anderson & McBeth will build a warehouse on King Street at a cost of $100,000. The new structure will be six storeys high.

New Westminster, B.C.—A warehouse owned by the Brackman-Kerr Milling Co. was damaged by fire recently. The loss is estimated at $5,000.

Montreal, Que.—Henry Morgan Co., Ltd., will erect a million-dollar ten-storey factory building to occupy a block in the rear of their store on St. Catherine Street.

Winnipeg, Man.—A permit has been issued to the Martin, Bole & Wynne Co., for a warehouse to cost $57,000. The contract has been let to James McDiarmid & Co. D. W. Bellhouse is the architect.



High Bluff, Alta.—The Imperial Oil Co., which has headquarters at Carberry, will commence the erection of a new warehouse here, which will be used as a distributing point for the vicinity.

Regina, Sask.—Tenders are being received by the Deputy Minister of Public Works, Regina, up till June 5 for the erection of a building for a court house and land titles office at Humboldt. The building will be 100 by 63 feet of reinforced concrete fire-proof construction, with stone facing, two storeys in height. Plans, specifications, forms of tender and all information may be obtained on application to the Department.

Wood Working

Deseronto, Ont. — The Rathbun Co. plant was damaged by fire on June 1. The loss is estimated at about $4,000.

Strathroy, Ont. — The sawmill and stave works owned by James Dogue were completely destroyed by fire on June 3. The origin is unknown and the loss will amount to $10,000, fully covered by insurance.

Have You Heavy Duty Milling Work?

Then a Heavy Duty LeBlond Miller is the first consideration.

Who Have Been More or Less Prominent in Machinery Circles

Personal

Sir William Van Horne, director of the C.P.R., sailed on the Alsatian on June 4 for England. Sir William will be away about six weeks.

Frederic Nicholls, president of the Canadian General Electric Co., Toronto, has been appointed vice-president of the Dominion Coal Co., Ltd.

G. A. Myers, assistant superintendent of the Ingersoll Condensing Co., has been appointed superintendent of the Borden Milk Co., Truro, N.S.

C. J. Britton, manager of the Winnipeg branch of the Canadian Fairbanks-Morse Co., left last week on a trip to the Coast, for the purpose of observing conditions.

J. R. Duncan of the Vulcan Ironworks, New Westminster, B.C., has left for an extensive business trip to the Old Country. Mr. Duncan will visit several steel works, making Glasgow, Scotland, his headquarters.

William R. Perrin died at his home in Chicago on June 2, aged 50. Mr. Perrin was the architect of the new municipal abattoir at Toronto, Ont., and was also president of the W. R. Perrin Co., Toronto, manufacturers of packing plant machinery and filter presses.

Trade Gossip

Collingwood, Ont.—The big new freighter, John H. G. Hagarty, now under construction for the Chicago & St. Lawrence Navigation Co., will be launched on Wednesday, June 17.

Penticton, B.C.—The new C.P.R. lake boat, "The Sicamous," is being fitted out and will be placed in service shortly. The new boat is 200 ft. long, 40 ft. wide, 8 ft. deep, and has a carrying capacity of 900 tons.

Wettlaufer Bros., Toronto, manufacturers of concrete mixers and other contractors' machinery, have secured temporary offices in Regina, and will shortly build a warehouse there. A. E. Hodgert will be manager.

The Lauzon Engineering Co., Ltd., engineers and contractors, of Levis, P.Q., were awarded the contract by the city council for the paving of Laurier avenue and Commercial street, Levis. The paving is to be done with the "Medal" vitrified paving block.

Halifax, N.S.—The Halifax Dry Dock Co. will repair the steamer Hochelaga, recently damaged in the Gulf. In competition with several New York firms, S. M. Brookfield, Ltd., of Halifax, was awarded the contract. The damage to be repaired consists of about 55 plates and will take about 30 days to complete.

Victoria, B.C.—A dispatch from G. H. Barnard, M.P., to the Board of Trade says the specifications for the $4,000,000 drydock to be built by the Dominion Government at Esquimalt are now in the hands of the King's Printer. Tenders for the work are to be invited immediately, the call for these extending over a period of two months. As soon as possible after their reception, the contract will be awarded, and the work of building the drydock will commence.

WHO'S WHO.

H. L. PEILER.

President, H. L. Peiler & Co., Montreal and Toronto.

Saskatoon, Sask.—Frid-Lewis Co. Ltd., have been awarded the contract for the construction of the building to be erected for the Saskatoon Cold Storage Co., Ltd., at a cost of $38,000. The site is the corner of 25th street and Ontario avenue, and the building will be 60 by 165 feet. The building will be brick and mill construction with full-sized basement and two stories in height, but designed to carry two additional stories later on. All the floors and walls will be insulated. The architects are Thompson and Crockart.

New Incorporations

The Marine Navigation & Engineering Co. has been incorporated at Victoria, B.C., with a capital of $100,000, to carry on business at Vancouver, B.C.

The Stephens Engineering Co. has been authorized to engage in business as engineers and contractors in the Province of Ontario. The company is capitalized at $36,000, and has its head office in Toronto, Ont.

The Grand Lake Steamship Co., Ltd., has been incorporated at Fredericton, N.B., with a capital of $20,000, to operate a line of steamers, registered at the port of St. John.

The Canadian General Fire Extinguisher Co., Ltd., has been incorporated at Ottawa, with a capital of $100,000, to deal in fire protective apparatus at Toronto. Incorporators—J. A. Kent, J. H. McDonald and C. W. Thompson, of Toronto.

The Stockwell Motors, Ltd., has been incorporated at Ottawa, with a capital of $100,000, to manufacture all kinds of motor vehicles at Montreal. Incorporators—F. B. Stockwell, E. E. Leger and H. E. Walker, of Montreal.

The Oakville Basket and Veneer Co., Ltd., has been incorporated at Toronto, with a capital of $100,000, to manufacture baskets, etc., at Oakville, Ont. Incorporators—J. M. Bullen, F. H. Hurley, and R. G. Agnew, all of Toronto.

The Niagara Silk Co., Ltd., has been incorporated at Toronto, with a capital of $150,000, to carry on business as silk merchants at Brantford, Ont. Incorporators—A. J. Baker, J. T. Shanahan, of Buffalo, and F. Mann, of Brantford.

The Canadian Hart Accumulator Co., Ltd., has been incorporated at Ottawa, with a capital of $60,000, to carry on business as makers of electrical apparatus at St. Johns, Que. Incorporators—G. W. Kidd, E. J. Clark and T. Prestige, all of London, England.

The Davie Shipbuilding and Repairing Co., Ltd., has been incorporated at Ottawa, with a capital of $500,000, to carry on business as shipbuilders at Lauzon, Que. Incorporators—G. D. Davie, A. C. Davie, of Lauzon, and T. A. O'Neil, of Quebec.

The British Columbia Steel Works, Ltd., have been incorporated at Vic-

The Ford-Smith Machine Company

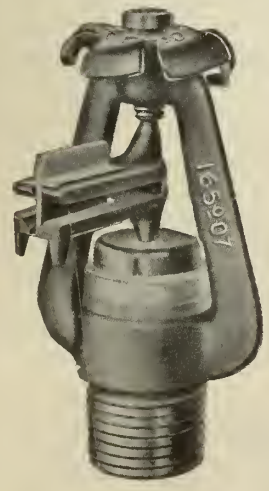
THE GRINDER

illustrated is our Lighter Type Self-Oiling General Purpose Shop Grinder, a very handy, low-priced, capable tool, built in sizes for 12 to 18" Emery Wheels.

A thoughtful distribution of these in your shop will quickly repay their cost in improved output and labor saved running back and forth to a central machine.

The **HACK SAW** is also a General Purpose Machine of low cost. Well designed; splendid wearing features; strong and rigid. It is capable of doing a good deal more than the best blades will stand, and will give excellent service through a long life.

Our new catalogue will interest you, and is a mighty handy reference book for your Grinder equipment. Write to-day for your copy.



The Ford-Smith Machine Co., - Hamilton, Ontario

Get the fire before it gets your plant

By Installing

Manufacturers' Automatic Sprinklers

You will be guarding against disastrous fires and the consequences.

Insurance Companies reduce rates about 80% on all Plants protected by these Sprinklers, because they know that a fire rarely gets any headway with these efficient firemen on the job night and day.

Write us for estimates on equipping your old and new Plant. Do it now, lest you forget.

The General Fire Equipment Company

Limited

72 Queen St. East **Toronto, Canada**

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers. We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

We can finish steel stampings in Nickel, Brass or Copper.

Send us a sample order.

W. H. BANFIELD & SONS
120 Adelaide St. W., Toronto

Manufacturers' Agents

We frequently receive inquiries from manufacturers of machinery specialties or supplies, asking us to suggest the names of reliable agents who might be interested.

For the benefit of Manufacturers' Agents who are subscribers to "Canadian Machinery," we maintain a bureau of information regarding agencies available.

We will be glad to hear from reliable agents desiring suitable lines, in order that we may put them in touch with enquiring manufacturers.

State lines you are specially interested in, and see if we can't connect you with something worth while.

Your name will be kept on file and you will be communicated with from time to time, as occasion arises.

toria, B.C., with a capital of $500,000, to carry on business at Vancouver, B.C.

The Monarch Refillable Fuse Co., Ltd., has been incorporated at Toronto, with a capital of $40,000, to manufacture refillable fuses at Hamilton, Ont. Incorporators—S. Coons, J. Culp, and R. A. Gibson, of Hamilton.

The Dominion Clay Products Co., Ltd., has been incorporated at Toronto, with a capital of $350,000, to manufacture brick, etc., at Toronto. Incorporators—A. W. Wright, W. C. Bonnell, and J. J. Beck, all of Toronto.

The Canada Furniture Manufacturers, Ltd., has been incorporated at Ottawa, with a capital of $3,000,000, to manufacture furniture at Woodstock, Ont. Incorporators—J. S. Lovell, C. D. Magee, and W. Bain, all of Toronto.

The F. W. Anderson Co., Ltd., has been incorporated at Ottawa, with a capital of $50,000, to manufacture chemicals and other products. Incorporators—H. Riley, W. B. Sturrup, and W. R. Anderson, all of Toronto.

The "Welo" Steam Specialty Co., Ltd., has been incorporated at Toronto, with a capital of $40,000, to carry on business as engineers and agents in Toronto. Incorporators—R. Winn, G. L. Smith, and R. H. Greer, of Toronto.

The Vanstone-Reade Mfg. Co., Ltd., has been incorporated at Toronto, with a capital of $40,000, to manufacture hardware at Oshawa, Ont. Incorporators—J. B. Reade, L. N. Vanstone, of Toronto, and F. J. Bailes, of Oshawa.

The Premier Glass Co., of Canada, Ltd., has been incorporated at Ottawa with a capital of $3,000,000 to carry on business as glass manufacturers at Montreal. Incorporators: W. Taylor, W. C. Nicholson and J. M. Montle, all of Montreal.

The Dominion Motor Car Co., Ltd., has been been incorporated at Toronto, Ont., with a capital of $40,000, to manufacture automobiles at Berlin. Incorporators: H. Nyeberg, of Anderson, Ill.; M. Martin and M. Musselman, of Berlin, Ontario.

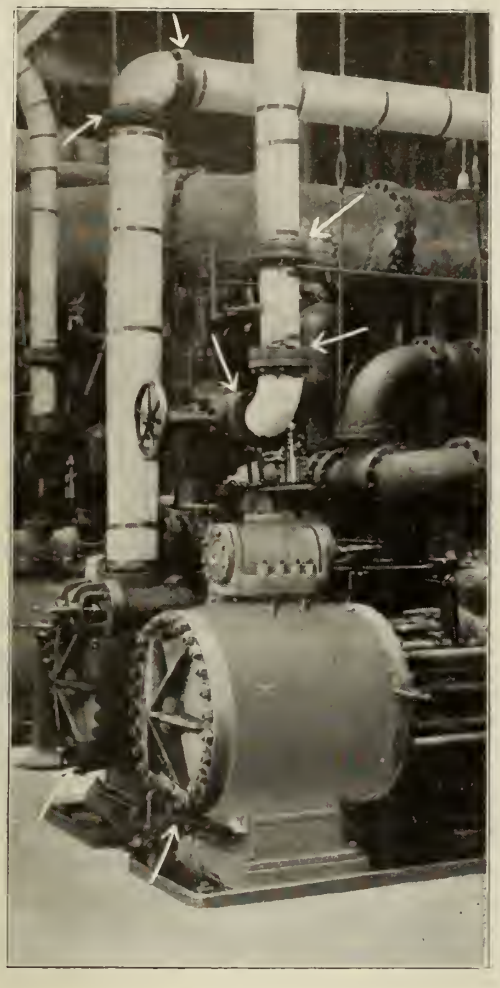
The Canadian Automatic Fire Alarm Co., Ltd., has been incorporated at Toronto, with a capital of $40,000, to manufacture fire alarms at Bracebridge. Incorporators—W. G. Scriver, A. McDonald, and E. F. Doonan, of Bracebridge, Ont.

St. Catharines, Ont. — The Canada Pole and Shaft Co., with head office in this city, has been incorporated under the Ontario Companies Act, to manufacture and deal in poles, shafts and vehicles of all kinds. Its capital is $400,000, in $100 shares, and the provisional directors are John S. Campbell, Vernon Moyer, and Harold Campbell.

Catalogues

Lubricators. — The Detroit "300" grease lubricator is described fully in a leaflet being distributed by the Detroit Lubricator Co., Detroit, Mich. The principal features of this lubricator are set forth and accompanied by illustrations.

Mesta Rope Drives is the subject of bulletin "O" mailed by the Mesta Machine Co., Pittsburg, Pa. The bulletin contains considerable matter dealing with the advantages of rope drives and valuable information on the life of Manila ropes. The illustrations include views of several installations, large rope sheaves and a typical mill layout.



Lincoln Arc Welder is described in detail in a bulletin issued by the Lincoln Electric Co., Cleveland, Ohio. The subject of electric welding is discussed and operation of the "Lincoln" welder dealt with fully. The illustrations include a sample of work done, an efficiency test curve and a welder dissembled. A price list is included for both a.c. and d.c machines.

Motors and Generators made by the Lincoln Electric Co., Cleveland, Ohio, are dealt with in three bulletins which have come to hand. The constructional features of the machines are described in detail with illustrations of the various parts of the type "F" motors and type "M" generators. One bulletin contains numerous illustrations showing views of installations, indicating the wide range of service possible with these machines.

Feed Water Meters.—The Canadian Allis-Chalmers, Ltd., Toronto, have sent us a very attractive catalogue descriptive of the "Cochrane" feed water meters made by the Harrison Safety Boiler Works, Philadelphia, Pa. The advisability of metering feed water and various methods employed are dealt with at length. A full description is given of the "Cochrane" metering heater, covering the design and construction, accompanied by numerous illustrations of various types, including installations. A list of users is given while the concluding pages contain much useful information relative to steam boiler economy, properties of saturated steam, boiler heat balance, etc.

Book Reviews

Abstracts of Current Decisions on Mines and Mining, is the title of bulletin

Where Good Packing Counts

High pressures and low, steam, water, gas, air, ammonia, oils, greases and acids—there is always perfect union when Goodyear Packings are used. No need to constantly dismember pipes to renew packing. No escaping steam—no lost power—no acid fumes—no lost motion—no lost dollars. Goodyear Packings save equipment, time and money.

"Red Magnet" Sheet Packing

A strong, tough packing, made for medium pressures. Withstands a higher pressure than ordinary sheet packing. Soft and resilient. Adapts itself to any unevenness of flange. Expands and contracts without becoming hard and brittle. Retains its consistency far beyond life of average red packing. Made in 250 to 300-pound rolls, 36 inches wide. In various thicknesses up to ¼-inch. "Red Magnet" is also made with brass wire or iron wire insertion.

GOODYEAR TORONTO PACKING

Goodyear Valves

A Goodyear valve for every service and pressure. Hot water, cold water, condenser, for mine pumps, vinegar and acids.

Goodyear experts have designed each Goodyear valve for exact individual purposes. You do not have to use the wrong valve in the wrong place with Goodyear service to guide you. There's more to the valve question than many people think. Have Goodyear tell you why.

Use Goodyear Efficiency Service

Remember, that Goodyear makes everything in rubber supplies for power plants — Packings — Valves—Hose—Belting. Every exact need anticipated and met in every Goodyear product.

For *service*—and that is real economy—buy supplies the Goodyear way. Goodyear experts will gladly confer with you at any time on any problem of rubber equipment.

Bear in mind that Goodyear quality and service are the same in Mechanical Goods as in Automobile Tires — all made in the Goodyear factory at Bowmanville, Ontario.

The Goodyear Tire & Rubber Co. of Canada, Limited

Head Office, Toronto **Factory, Bowmanville, Ontario**

No. 79, published by the Bureau of Mines, Department of the Interior, Washington, D.C. The bulletin covers abstracts of decisions handed down from March to December, 1913, inclusive, and is a continuation of a series published with the purpose of improving directly or indirectly mining conditions and to promote the health and safety of miners by the prompt publication of decisions.

Heat.—By E. M. Shealy, 262 pages, 6 x 9 inches, 110 illustrations, cloth. Published by the McGraw-Hill Book Co., New York. Price $2 net. This book is one of a series prepared by the Extension Division of the University of Wisconsin, and deals with the application of heat to various types of machinery, such as steam and gas engines, air compressors and refrigeration plants. The text is designed to supply the fundamental knowledge necessary for the successful study and understanding of this class of machinery and may also be regarded as a foundation for advanced studies, treated as separate courses. The first part of the text treats of the fundamental laws relating to the nature, generation, and transportation of heat and presents familiar examples of practical applications. The expansion and compression of gases and the nature and properties of steam, ammonia and carbon di-oxide, etc., are taken up. In the latter part of the book the principles of the steam engine, gas engine, refrigerating machine, and air compressor are treated, and the relation of the laws of heat to these units is shown. The first six chapters deal with temperature, work and power, energy, transferring, generation and measurement of heat. Then follow chapters dealing with compression and expansion of gasses, properties of steam, condensation and evaporation. Chapters 11 to 15 are devoted to steam and gas engines, air compressors and refrigeration, while the last chapter deals with various methods of heating buildings. A number of very useful tables are given which will be helpful to the student, while the illustrations are clean cut and descriptive. At the end of each chapter is a series of questions which should materially assist also in obtaining a clear understanding of the text. The author, is assistant professor of steam engineering at the University of Wisconsin.

Cable Address:
Cook, Hartford, U.S.A.

Asa S. Cook Co.

Hartford,
Conn.

We manufacture Rivets of every description, ½ inch dia. and smaller.

FARMENTER & BULLOCH CO., LTD.
GANANOQUE, ONT.

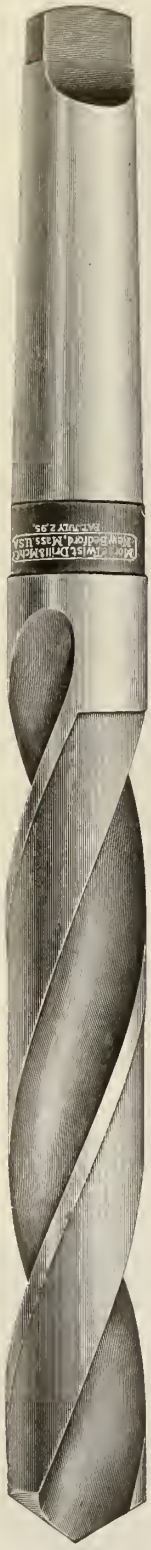
ATTENTION !

Bridge Builders Structural Steel Workers

NOVO HIGH-SPEED STEEL Annealed

Are your Bull-Dies lasting continuous usage 8 days without re-cupping ? If not, try "NOVO."
No Hardening. No tempering. No re-annealing for re-cupping.

BRIDGE BUILDERS, REAMERS—Are yours averaging 30 to 40 hours continuous usage without regrinding? If not, try Novo—or send trial order for Novo Reamer. We carry all standard sizes in stock.



Your inquiries are respectfully solicited.

Hermann Boker & Co., - - - - - - - - - 332 St. James St., Montreal, P.Q.

ARMSTRONG WHITWORTH OF CANADA
LIMITED
MANUFACTURERS OF CELEBRATED BRANDS OF
HIGH SPEED STEEL & DRILLS
"AW" FOR CUTTING ALL METALS AT HIGH SPEEDS
FOR HARD METALS — "TYR" RAILWAY & TRAM TYRES
OFFICE 22 VICTORIA SQ. MONTREAL — WORKS LONGUEUIL QUE.

The advertiser would like to know where you saw his advertisement—tell him.

"MORSE"

Every one of our lines has successfully stood the most exacting tests. They are the product of a factory which has every facility for making reliable tools and they are recognized everywhere as such.

We have never varied our policy as to quality, therefore, tools bearing our trade-mark ("Morse") are warranted to give satisfaction.

They include Twist Drills, Reamers, Milling Cutters, Taps, Dies, Cutters, Counterbores, Countersinks, Etc.

Carbon and High-Speed Steel.

Illustrated Catalog free.

Morse Twist Drill & Machine Co.
New Bedford, Mass., U. S. A.

40 Tons
Will not Crush a
7/8" Hoffmann Steel Ball

Hoffmann Steel Balls are recognized throughout the world as the best made. Each and every ball of whatever size is guaranteed **correct within**

$$\frac{1}{10000}\text{in.}$$

both in size and spherity.

We carry all sizes, also a complete stock of Journal and Thrust Bearings in all sizes.

"ERIE" Steam Hammers

Built in all sizes and types. Strongly constructed and properly designed.

Every "Erie" hammer is equipped with our Safety Piston Stop which is a positive safeguard against breakage of cylinder heads.

Write us for Details.

Erie Foundry Company

ERIE, PENNSYLVANIA

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, OHIO Chicago

No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.

Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.

How to use Stevens' Stopper, or Circle Cement:

Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.

Another thing—I do not ask a fancy price for it.

A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

FREDERIC B. STEVENS

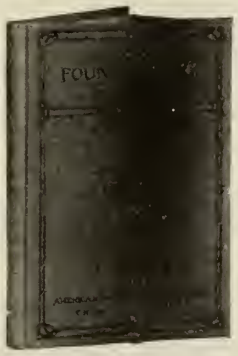
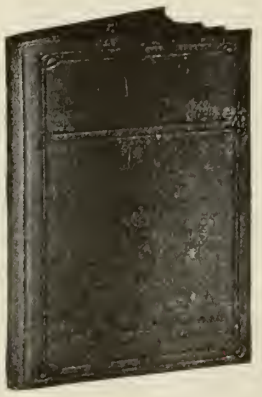
Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

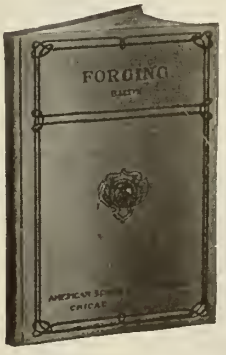




MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price $1.00



PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels —annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.50

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

You May Have This Book Without Spending a Cent

if you are a subscriber to "Canadian Foundryman," by sending in to us four new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.

Foundry Work

By Wm. C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with four yearly paid-up subscriptions.

The subscription price is fifty cents per year; two years for one dollar.

Who Wants Your Order?

¶ The firms that are most likely to appreciate your order are the ones that are keenest to get it.

¶ The firms that advertise are bidding for your business in a broad, yet personal way,—the modern way. They are proud of their goods and are not ashamed to show them in public to the most critical.

¶ Patronize the firms that advertise. Consult this directory of machinery manufacturers and supply houses and you will connect with good concerns.

¶ A firm that appreciates your order will serve you well.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

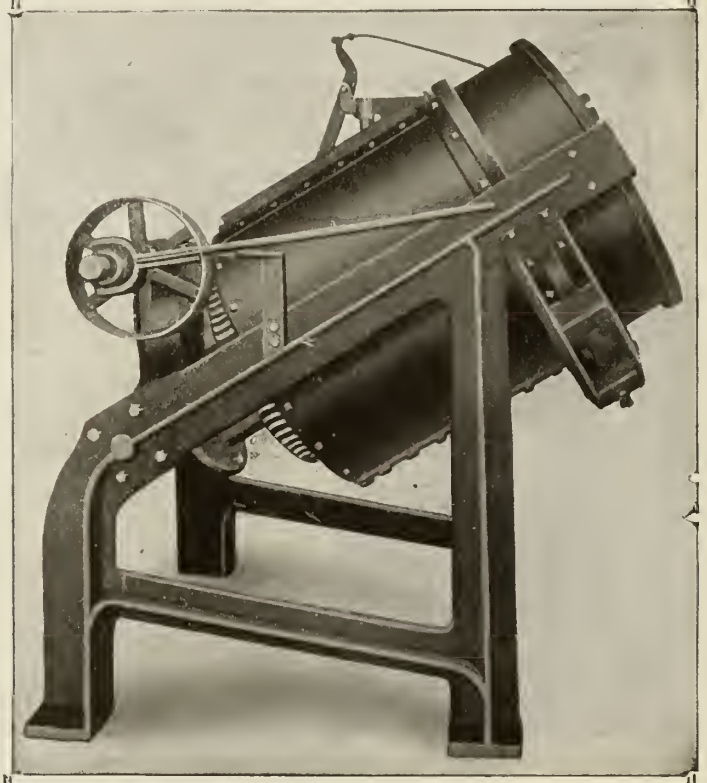
THE ONLY ABSOLUTELY FIREPROOF MALLEABLE PLANT IN CANADA



CASTINGS

High Grade Malleable Iron Castings
CAPACITY OF 5000 TONS
Let Us Quote Prices
CANADIAN MALLEABLE IRON CO. LTD.
OWEN SOUND, ONT.

CASTINGS

ALL CASTINGS GUARANTEED TO YOUR APPROVAL

The "No-Wear" Nozzle
An exclusive feature of the
"Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

The W. W. Sly Mfg. Co.
CLEVELAND, OHIO
Complete Sand Blast Rooms and Equipment a Specialty

PERFORATED METALS

Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

Canada Wire & Iron Goods Co., Hamilton

We also manufacture

Wire Cloth for all purposes
Concrete Reinforcement
Molders' Riddles and Bellows
Metal Clothes Lockers
Steel Factory Stools
Window Guards
Ornamental Wire and Iron Work

High-Speed Steam-Hydraulic Forging Presses

Double your production with one-half your labor cost and steam consumption reduced. Eliminates heavy shocks and vibration. Cost of repairs

"SINGLE LEVER CONTROL"

Small sizes—single-frame type. Large sizes—four-column type.
Built for doing all classes of forging, shearing or pressing

100 Tons to 12,000 Tons Capacity

McDougall Gap Lathes

Strength
Accuracy
Quality

ARE-MAC-DEE IS A GUARANTEE

Take a look at the next money you intend to invest in a Lathe.
Then, take a look at the money's worth we offer you in our machine.
Your money will soon come back to you in increased production and we will have the pleasure of having a satisfied user. Our machines are just as good as they look and they look good too.
We invite the closest inspection.

Particulars on request.

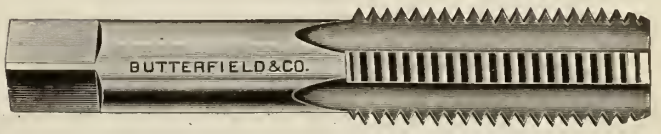
BUTTERFIELD

Taps, Dies, Reamers & Screw Plates

Their cutting speed—their accuracy, and their durability assure greater output with less tools, and work at the highest stage of perfection.

Once used they are always used.



We'd appreciate the opportunity of putting you in touch with some well-known manufacturers who use our tools exclusively. We want you to profit by their experience.

Ask for names, and catalog.

The Power Bill

Should be the determining factor when you are considering the installation of an **Air Compressor** in your shops. The more air you use, the more attention you should pay to compressing it economically.

Class 18 Duplex Belt-Driven Air Compressor with Cincinnati Valve Gear

Laidlaw-Dunn-Gordon Compressors

are built by specialists in Air Compressor work.

CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

MONTREAL, Eastern Townships Bank Bldg. TORONTO, 143-149 University Ave. WINNIPEG, 34 Royal Bank Bldg. LONDON, ENG., 88 Fleet St., E.C.

Vol. XI Publication Office: Toronto, June, 18 1914 No. 25

COLONIAL WIRE MFG. CO., LIMITED

WORKS: LACHINE CANAL, MONTREAL

MANUFACTURERS OF

Smooth Steel Wires—Bright, annealed, oiled and annealed.

Tinned Mattress Wire, Bottling Wire, Fine Wires—Plain and Galvanized.

Fence Staples—Wire Nails—Wood Screws

Pump Rods—Plain and Galvanized.

SELLING AGENTS:

CANADIAN TUBE & IRON CO., LIMITED, MONTREAL

CANADIAN ROLLING MILLS CO., LIMITED

WORKS: LACHINE CANAL, MONTREAL

MANUFACTURERS OF

Bar Iron and Steel: Rounds, Squares and Flats.

ALSO

Twisted Steel Bars for Reinforcing

SELLING AGENTS:

CANADIAN TUBE & IRON CO., LIMITED, MONTREAL

CANADIAN TUBE & IRON CO., LIMITED

MANUFACTURERS OF

Bolts and Nuts

Carriage Bolts,
Coach and Lag Screws,
Tire Bolts,
Machine Bolts,
Sleigh Shoe Bolts,
Plow Bolts,
Track Bolts,
Square Nuts,
Hexagon Nuts,
Boiler Rivets,
Tinners' Rivets, Etc.

TRADE MARK

Wrought Pipe

Black and Galvanized, sizes ⅛ in. to 4 in., is thoroughly inspected and tested to 600 lbs. pressure, and every length is branded with our trade-mark.

We also manufacture NIPPLES in all sizes—black or galvanized.

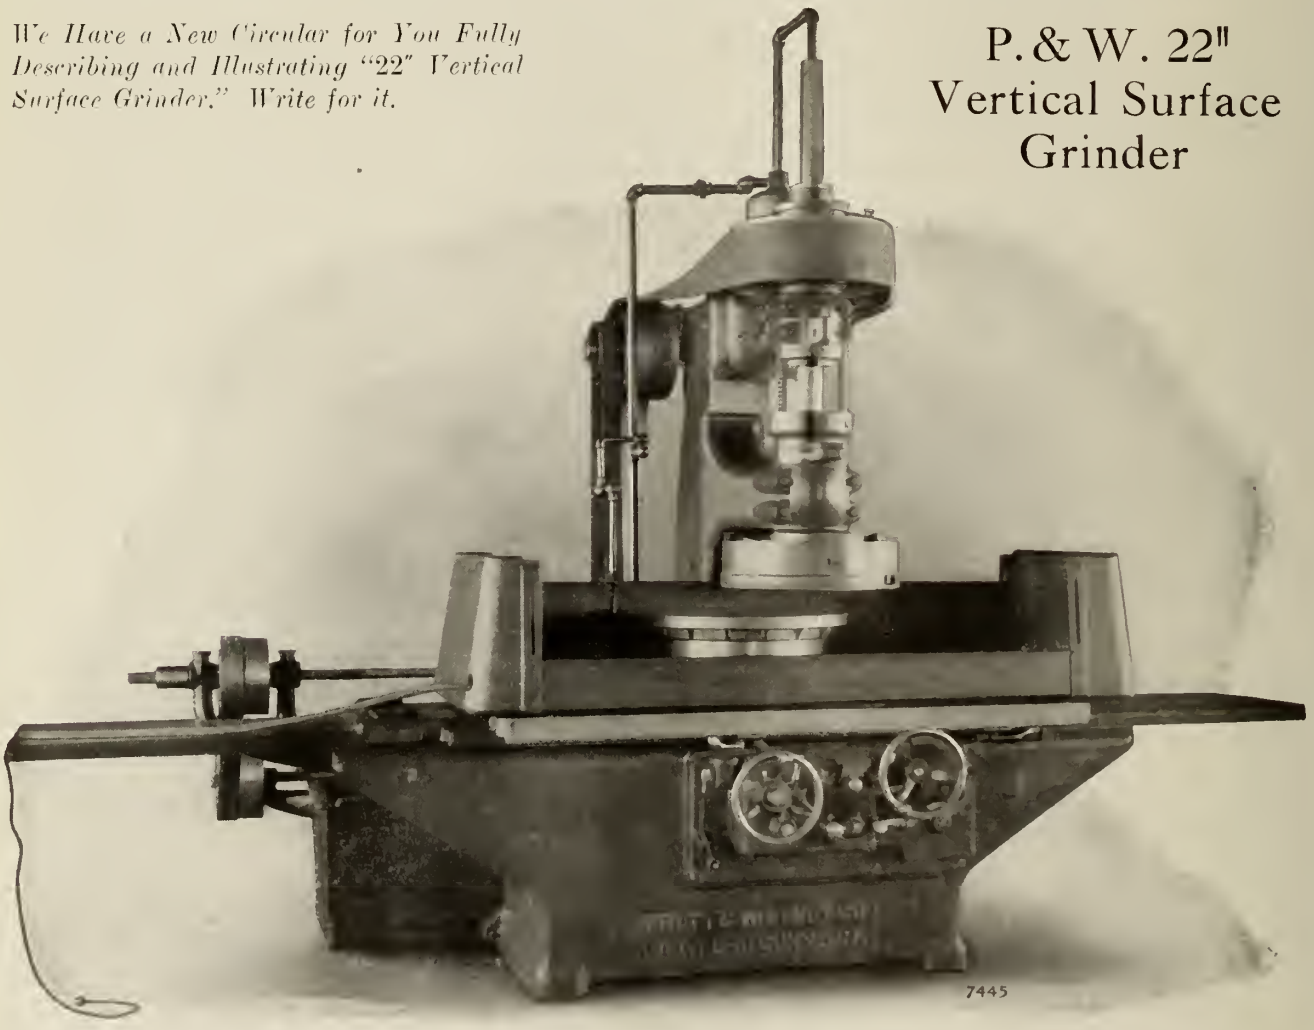
WORKS: LACHINE CANAL, - - MONTREAL

Big Output on Saw Grinding

New Surface Grinder, with 22" Wheel, Weighing 16,200 lbs., and Driven by 35 H.P. Motor through 8" Belt, shows Highest Production of which Modern Grinding Wheels are capable.

Massive Construction. Although the proportions of this machine are unusually large, it is made with the greatest care throughout and is a precision tool in every particular. The control is very sensitive and easy to operate, all levers and handwheels being concentrated in one unit within easy reach of the operator.

Ball Bearings. The spindle and driving pulley are provided with ball bearings throughout. Loss through friction is negligible and practically the entire power is utilized for driving the wheel.



Efficient Chucks. For grinding circular saws, either the single or duplex magnetic chucks are used, depending on the size of the work and the output desired. When the duplex chuck is used, the remarkable productive capacity of this machine is practically doubled. Both of these chucks can be tilted for grinding the concave surfaces of the saws.

For the longitudinal saws, the rectangular magnetic chuck is used.

Rapid Power Traverse for Table. In addition to two power feeds, the table is provided with power quick return motion for use in connection with rotary chucks.

We Have a New Circular for You Fully Describing and Illustrating "22" Vertical Surface Grinder." Write for it.

The Cost and the Profits of Progress

Theodore N. Vail is President of the American Telephone & Telegraph Co. His salary is $100,000 a year. The following incident shows one reason why he has been successful. It is taken from an article in McClure's Magazine for May:

"In 1909 Vail took a look over the property of the big telegraph concern (the Western Union). He rode around the country in his private car and made mental notes. Everywhere he saw equipment in the Western Union that reminded him of the days of his grandfather.

"'Find out what this stuff is worth to-day,' he said to his men.

"After a merciless appraisal they came back to him.

"'The actual value of the stuff,' they told him, 'is about $14,000,000 less than the books indicate.'

"The old-time Western Union men were aghast. 'What are we to do about that $14,000,000?' they asked.

"'Charge it off,' said Vail.

"It was wiped off the slate in a lump, and new equipment was gradually ordered. To-day the Western Union is emerging as a sound, wide-awake business."

This is a very striking example of a practice that is characteristic of American Business—the practice of paying the enormous sums demanded by the "Cost of Progress" because the "Profits of Progress" far outweigh and soon pay back the cost.

Every thinking man must admire the way that industrial plants in this country send equipment to the scrap heap. In a majority of cases it is not because the equipment is worn out, but because some new equipment has been placed upon the market which is much better suited to the work.

We are brought face to face with such instances right along—and in a very pleasing manner. A considerable part of our business comes from progressive manufacturers who take out their old equipment and install Milwaukee Millers—because the extra profits to be secured from our machines outweigh the cost of scrapping the old equipment.

In our plant, also, Progress has from time to time exacted a price in the shape of discarded patterns and equipment. The toll we have paid has been the larger because every change we have effected in our machines has been a complete one.

Our first important change had to do with the drive. Investigation and experiment showed us that the constant speed-drive was much more effective than the cone pulley drive. We immediately discontinued manufacturing milling machines of the cone pulley type, and have ever since been the only milling machine manufacturers who build constant speed drive machines exclusively.

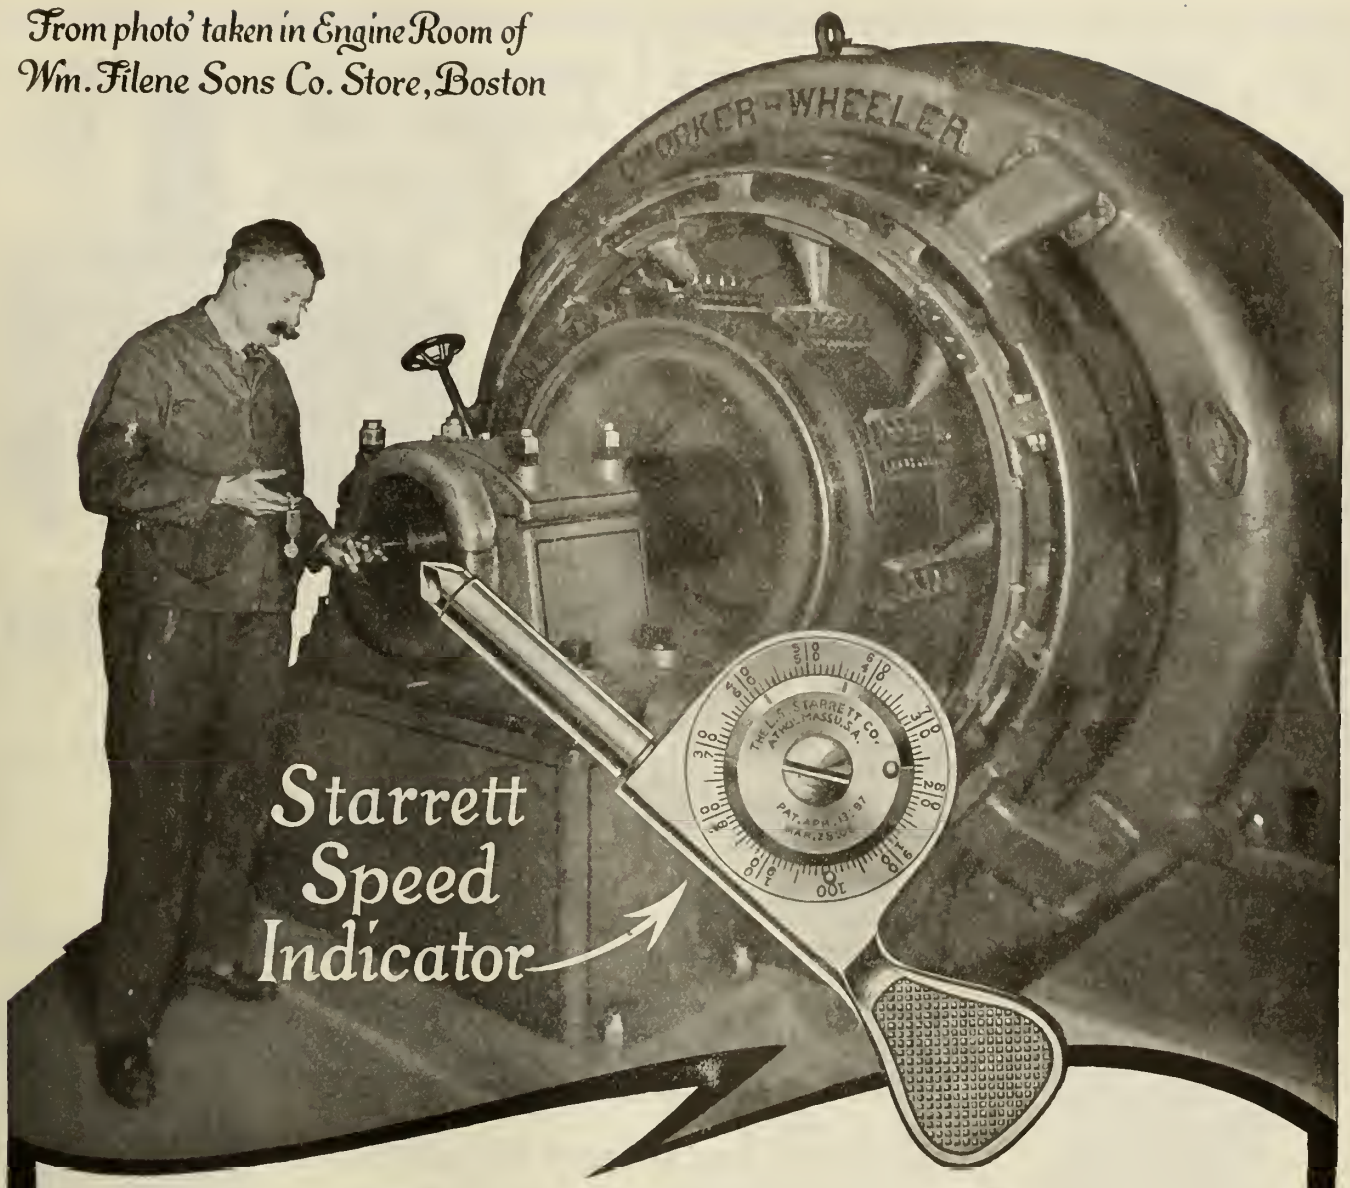
Our next change affected the lubrication. We invented a cascade lubricating system whereby all gears and bearings not only are lubricated at all times, but are also continually flushed of all dirt and grit that would cause scoring and heating. This patented feature has since been a part of every Milwaukee Miller, and has been of the utmost importance in securing the excellent results for which our machines are noted.

Then we changed our method of driving the cutter or arbor. We eliminated the screw thread on the spindle, which made it impossible for cutters to be driven in either direction, and onto which the cutter or arbor would frequently set tight, giving great trouble. Instead, we flanged the end of the spindle and milled a keyseat across the face of the spindle. This keyseat receives a key which is used to drive either the notched collar that fits the dogs on the arbor or face milling cutters, which have a keyseat across the back face corresponding with the key in the face of the spindle. This feature has since been an essential of every Milwaukee Miller.

Many other changes followed, each taking its toll in discarded equipment, but paying back large dividends by giving us better machines to sell.

The latest change—and one of the most important—was the double over-arm. Instead of the single over-arm we used previously, we use two steel bars. These are arranged accurately parallel with the spindle and at sufficient distance to form a rigid truss for the cutter arbor when the arbor bearings are clamped to them.

We have proved to our satisfaction that the cost is negligible when compared with the profits of Progress. Manufacturers are installing Milwaukee Millers because they have proved likewise. It pays.



The complete facts about Milwaukee Millers are intensely interesting and valuable to milling machine users. We will gladly send our new Catalog No. 19, which gives the complete facts.

We are glad to have you consult us on any milling problems.

Every Mechanic Should Have a Starrett Speed Indicator

Men who work about machinery should have this indicator for taking speed on engines, generators, turbines, motors, line shafting, grinders, etc. It is the simplest, most accurate instrument made. It is especially valuable in taking speeds when computing engine horse power, etc. With the rubber wheel attachment it may be used to figure surface speeds. It indicates highest speed without heating. The parts are enclosed like a watch.

Made in three styles, prices $1.00, $1.50 and $3.00.

Send for catalog No. 203 to make your selection.

Where Accuracy Counts

In your Filing Department, where "accuracy" is the watchword, you can rely on

NICHOLSON-MADE-FILES

Their use speeds up production, and increases accuracy as well.

They cut unusually deep—have exceedingly long service—life—and are uniform in "feel" and "draw." Workmen lose no time—waste no material—in "getting the hang" of these files.

With an output of 50,000,000 yearly, we control absolutely every step in the making of our files. From raw steel to finished file, we supervise every process. When a NICHOLSON-MADE-FILE passes our system of rigid inspections and practical tests, it is by far the most efficient and economical type of file that can be made for its purpose.

As a time-saving, money-making, accuracy-assuring proposition, NICHOLSON-MADE-FILES should be used in every shop.

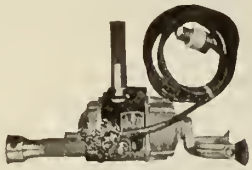
No. 95 Double-Crank Press, Geared



"For Rigidity of Construction, Simplicity and Ease, You Can't Beat the 'BB' Press."

Our Double-Crank Presses are used very extensively in the manufacture of large sheet iron and steel goods, such as steel ranges, metal shingles, paneled ceiling, and siding for buildings, cornice work, drip pans, armature discs, etc., and gang punching. They are particularly desirable where dies extending over a large area are used. The two pitmans are so connected that they are always adjusted simultaneously, thus enabling the operator to quickly raise or lower the slide to suit thickness of dies without any danger of getting the face of slide out of alignment with bed of press. For heavy work the presses are geared.

Secure copy of our Press catalogue, and let us quote on your next press.

Grinding Wheels in Interchangeable Manufacturing

By John Edgar

The present success in the methods of interchangeable manufacturing is largely the result of the grinding process. For instance, the automatic grinding of cylindrical parts is now taken for granted, whereas in a no distant past such was looked upon as a refinement, and called for only in precision work. Grinding of the general run of work is now a commercial necessity.

THE facility with which machine parts are sized is responsible for the general adoption of grinding, as also the fact that interchangeable manufacturing calls for the accurate sizing of parts within narrow limits. The grinding process has the additional quality of producing true work of uniform size throughout the whole length, which is not commonly the case in the results from the lathe. Its cheapness is also now readily acknowledged in comparison with that of the lathe, and, wherever tried, general adoption followed.

To get results, the wheel conditions, its feed and speed must be properly selected, and in order that these may be intelligently chosen, the different qualities of wheels in grade and grain must be familiar, then the proper wheel to use under particular conditions is only a matter of experience and judgment. The ordinary emery wheel is little used in the process of modern automatic grinding, emery having given way to the harder and better cutting abrasives, such as corundum, alundum, crystolom, carborundum, carborite, aloxite, adamite, etc.

Emery, the oldest of the abrasives in common use, is not a pure mineral, but contains a large percentage of iron, which has no abrasive quality. This makes emery a poor substance to use, as it becomes dull so quickly, and the wheel has a tendency to glaze when used on the harder grades of material. Corundum is also a natural abrasive and is largely used in automatic grinding, and in proper grades is a good substance for all-round work, being better adapted, however, to the grinding of hard and soft steels. The other abrasives mentioned are artificial, being the product of the electric furnace. They are much harder than the natural product of the mines, and being under constant control in the making, can be graded to any temper desired. Carborundum is the hardest substance known, coming next to the diamond.

Grading the Abrasive.

The abrasives are crushed and then run through sieves, the mesh of which varies from coarse to fine. The fineness of the particles as let through the meshes are graded by the size of the holes in the screens and are given a grading number corresponding to the number of holes to the inch; thus, a mesh of 36 holes to the inch is used to grade 36-grain abrasive. The powdered abrasive is first screened through the finest sieve as 100, and what remains in the sieve is then screened through a coarser sieve, and so on until the coarsest grade has been screened. Thus we have the grain of the wheel corresponding to the size of the particles of abras-

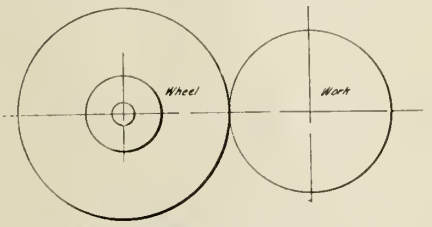

FIG. 1. SHOWING BROAD CONTACT ON LARGE WORK.

ive used in its making. Wheels are often made up of different grains and are termed combination wheels.

Forming the Wheel.

In forming the abrasive into a wheel it is necessary to use a bond to hold the particles of abrasive together. This bond is used as a cement and is usually composed of shellac, silicate of soda, or some sort of clay. Shellac is a strong bond and is used in the make-up of the so-called elastic wheels. The strength and elasticity of this bond make it safe for use in thin wheels. Shellac-bonded wheels are noted for their smooth cutting, and can be used for facing shoulders of considerable depth. Another form

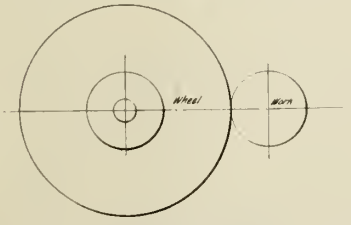

FIG. 2. SHOWING NARROW CONTACT ON SMALL WORK.

of elastic wheel is made with a bond of rubber or celluloid. These are not as free cutting wheels as the shellac-bonded and are used only in cases where an extra thin wheel is required.

Most wheels in use are bonded with clay and baked in a manner similar to the methods in the manufacture of brick, and are known as vitrified wheels. This process of wheel-making produces a very pure wheel and one unaffected by heat, cold, water, acids, oils, etc. They are porous in texture and the ease with which the grains are torn out when they become dull assures a free cutting wheel which will not clog up with particles of the materials on which it operates. This feature has its draw-backs, however, in the fact that the wheels are not so strong as those of the elastic bond and have practically no elasticity. Side cuts on thin vitrified wheels are dangerous. The process requires at least a month in the manufacture of the wheel, which is a decided disadvantage when a special wheel is desired.

The bond, silicate of soda, produces a wheel that has many of the advantages of the vitrified wheels, and the process of manufacture is more easily controlled, while a wheel can be produced in a much shorter time than that required to make the vitrified wheel, but silicate wheels of the finer grades are not as dependable as those of the vitrified process.

Wheel Grading.

Wheels are graded according to the strength of the bond, whether hard or soft. The wheels of weaker bond are the softer, while the hard wheels are those in which the particles are held strongly in place. The method of grading is the same with all manufacturers, although they have no uniform system as yet of designing the grade. The Norton Co. use the alphabet, running from soft to hard, while the carborundum wheels are graded just the opposite, the grades running from hard to soft. In the grading of elastic wheels, makers seem to recognize a more uniform grading as they all use the numerical system. The grading of the bond is not the only condition that determines the hardness of the wheel, as the grain of the material will have considerable influence on this, due to the finer grains forming a much more compact wheel. Therefore, a wheel of say 100E, will be harder than one of the same grade, but of 60 grain.

The success of the grinding process depends on the removal of the metal with little or no generation of heat, and to do this, the wheel must cut freely. This free cutting feature must be obtained with as little wheel wear as possible, or the work will not be true to size the whole length, this being more aggravated in the case of very long pieces.

Theory of Grinding Process.

The theory of the grinding process is that as the points of the grains of abrasive on the periphery of the wheel

are dulled they are torn out and new points present themselves to the work. If the points on becoming dull are not removed, the wheel must be forced into the work, generating heat, and glazing of the wheel results in the springing of the work and in chattering. The ideal condition is obtained when the wear of the wheel is uniform and constant.

To obtain this condition practice has shown that for hard material a soft wheel is preferred, and for grinding soft materials a hard wheel is the more suitable. This is accounted for by the fact that the grains of abrasive become dull more quickly in grinding the harder materials and must be removed faster, a condition accomplished in the softer wheels. In the grinding of the softer materials again, the grains do not dull so quickly and they may be retained in place for a longer time, therefore to use a soft wheel would be a waste of abrasive as the wear would not be in proper relation to the dulling of the points of the grains.

Wheel Grade, Width and Speed.

The grade of the wheel is also conditioned on the size or relative size of wheel and work; thus, when conditions are such that the contact of the wheel is of considerable extent as in the case of large work, the grade must be much softer than when the conditions are the opposite. Thus, in Fig. 1 the wheel should be much softer than that in Fig. 2, as the points of the abrasives are in contact with the work a longer time and become heated and dull much quicker than in the case of Fig. 2, and the sharp contact in the latter case tends to break away the particles of the wheel much quicker than when the contact is broader.

The width of the wheel has an important influence on production, and as wide a wheel as possible should be used. The wider the face, the more cutting points there are in action at one time, and consequently the feed can be greater. A wide wheel is better adapted for the removal of large quantities of stock.

The speed of the wheel is limited in most cases to a surface speed of approximately 5,000 feet per minute, but this may in the case of some of the harder wheels be increased to 7,000 feet, although it is best to keep the speed down to that recommended by the makers, as they are in the best position to determine the safe speed. The latter is always marked on the wheel together with the grade and grain, and these should be stated when ordering duplicates.

It is not necessary to use a fine grade wheel to obtain a good grade of finish, as the softer wheel of comparatively coarse grain will, when run under the proper condition of speed and feed, give a good commercial finish. Much greater production can be had with the coarse wheels, as they are freer cutting, and do not require dressing so often. The speed of the work is also important in the quality of the finish and the quantity of stock that can be removed. A too high speed of work will result in its being torn, in filling up the wheel and in chattering. The relative speed of wheel and work and the feed can only be ascertained by trial. The adjustment of one to agree with the other will result in the greatest possible production under the circumstances.

When a proper selection of wheel, its speed and feed has been made, the wheel must be kept in true condition to obtain good results. It must be trued with a diamond held in a fixed rest on the platen and run across the wheel face with an even motion. A wheel that is not true will result in a finish having a torn appearance, whereas with a true wheel the finish has a gray, dull appearance and will show the feed marks. As the wheel becomes slightly dulled, the finish takes more of a polished appearance and if suited to the work will remain in this desirable condition for a considerable time without redressing.

To the beginner in the use of the automatic grinder, there is no advice that can be given which will bring greater results than that he submit his problems to the manufacturers of the machine and obtain their advice on the wheel to use, together with the speed and feed best suited to the particular purpose. The wheel manufacturer can also give good advice in the selection of wheels. The manufacture of wheels is becoming so advanced that it is not necessary to have a wheel for each piece of work, but by adapting the conditions of speed and feed the same wheel will cover considerable ground.

While what has been said in the foregoing is given with particular reference to cylindrical grinding, the same can be said for surface work. This latter is becoming more common and the perfection of massive machines for the grinding of large plane surfaces is now in progress. Surface work is now successfully done with a disk or cup wheel, and is the process used in the grinding of washers and rings.

Form Grinding.

A new system coming into vogue is that of form grinding, in which the wheel is wide enough to cover the length of cut and is fed into the work instead of along parallel with its axis. This method has been successfully used in the grinding of crankshafts of automobiles, and its use has spread to other parts of short length, being particularly suitable to any short pieces that are stout enough to stand the pressure of the wide cut. This form grinding is also used in surface work where the width of surface is not excessive. At present a maximum of 6 in. is the practice.

Modern methods of wheel manufacture make it possible to perform this peculiar operation by providing a wheel that will wear evenly across the face and not develop ridges in the work. It has been found that the wheel will wear evenly to any shape it is given originally, provided the work is of the same shape; thus, for example, it is possible to grind to form the teeth of gears with a formed wheel passing through many teeth without reforming. It is necessary for this class of grinding to have a wheel that is not too hard as, if so, the wheel will glaze instead of wear to the shape.

While it is difficult to give a general rule in the proper selection of wheels for all classes of work, yet it is possible to select a few wheels that will be found suitable to most cases that may be termed ordinary work. The Brown & Sharpe Co. recommend as suitable for general work the following wheels:—

External Cylindrical Grinding.

On soft steel—Alundum 36-L combination. Corundum 2850-L.

On hardened steel—either of above: 46-K.

On cast iron or bronze—Crystolon, 50-L.

For facing shoulders—elastic Corundum, 80-1½; but for a less fine finish a 1¼ wheel of the same grain and material will give better production.

Surface Grinding.

On hardened steel—Corundum 46-H. or 60-¾ elastic.

On hardened high-speed steel or thin pieces of carbon steel, 36-M is recommended.

On cast iron—Carborundum 36-M.

Wheel Speed and Work Relation.

The relation between the speed of the wheel and the work is of importance and should be carefully studied. This may not be as easy of attainment as it might seem, and in view of the fact that the finish and rate of production is dependent on this relation it is well worth considerable time in experimenting with different speeds till a satisfactory combination is found. The surface speed of the work should be maintained at about the same rate for the same wheel and to do this, the rate of speed for the work must be reduced in proportion to its diameter as the latter increases. Thus, a 3-in. piece should revolve at only one-third the number of revolutions used in the case of a 1-in. piece.

If the wheel run at the correct speed and the work be too slow the finish will not be satisfactory and the wheel will have a tendency to become clogged up

with particles of metal and cause it to chatter. On the other hand, if the work be run too fast, the wheel will wear away too quickly, and produce a rough finish, or it may glaze and chatter. If the wheel is running too slow it will wear rapidly and the finish will not be fine. When the wheel runs too fast the work will become heated from the glazing of the wheel.

Most automatic grinding is now done with the aid of a stream of water to keep the work cool, otherwise care has to be exercised to avoid heating the work and thereby cause it to spring out of true. The latter is very noticeable on surface work when grinding thin pieces parallel. The water also washes the grit from the wheel and helps to keep it from glazing too quickly.

The Care of Brass Working Machines and Tools

By P. W. Blair

The life and use of factory equipment is shortened much more by the other uses to which it is subjected than to any amount of applying it to the work for which it was intended. A few pertinent suggestions on preventing the misuse of machines are therefore in order.

CONSIDERABLE expense and trouble have been caused to manufacturers through lack of mechanical knowledge on the part of unskilled labor employed in the production of brass and metal goods. Manufacturers in the metal industries are fast realizing the importance of employing mechanics of a higher order and educating their employees to a better understanding of the value of tools, their proper care, upkeep and the necessary conditions of operation to insure a desirable and satisfactory product. This has become quite necessary in order to compete successfully.

As an example, take many up-to-date plants that have installed expensive automatic machines and tools and entrusted the care of them to unskilled employees, who through carelessness or ignorance soon have the machines in poor condition or out of commission altogether. On the other hand, a good mechanic who has had proper training and instruction takes a natural pride in a good machine, does his utmost to keep it in good working order, and sees to it that it is not misused or abused.

Thoughtlessness of Operators.

In my visits to manufacturing plants I have seen many excellent examples of the care and operation of machine equipment and tools, and have also witnessed quite as many extremely bad examples. It is with the bad examples in particular and the possible remedies that I wish to deal in this article, and shall refer especially to the troubles experienced in the operation of tools for cutting, boring and screwing threads, as applied to the different styles of turret lathes and screw machines. In some plants I have seen screw machine operators use a hammer or heavy wrench for driving the turret tools out or into the holes of the turret. Possibly the shank of the tool was slightly large for the turret hole, or it may be that the operator had not sufficiently loosened the binding screw to permit easy entering of the tool shank. Lacking in horse sense and caring little for the tools anyway, he drives them out again until the tool has the appearance of having been used in the smith shop for a striking hammer.

Of course, this treatment very quickly springs the tool shank and puts the tool in so deplorable a condition that good work is impossible, and if it shows up with no marks the next time it is put in use, some one blames the manufacturers of the tool and reports that it is no good, and will not do satisfactory work.

Doubless the man who writes the letters of complaint has no knowledge whatever of the true conditions, and his information comes from the machine operator through the foreman of the department or superintendent, and in many cases the machine operator is the only man who really knows where the real trouble lies. He is often too ignorant, it may be, to fully appreciate even the cause, for he has probably never been instructed not to use a hammer or anything with a hard surface in setting up tools in the turret. How then is he to get the tools into the turret holes if he does not use a hammer or anything that is handy to drive with? The tools were turned over to him to use on that machine, and if the shanks be slightly too large for the turret holes, or he does not happen to loosen up the clamping screws quite enough to give the shank access, his instinct tells him to take a hammer and drive it in or out. Besides, it does not cost him anything, so what difference does it make? The boss will buy another when this one is worn out.

When the superintendent investigates the cause of so much damage to tools and machines he is sometimes very much surprised, but he has so many things to attend to and look after that it is quite impossible for him to note all the details. The foreman on the job is generally taken to task for allowing these conditions to exist, but he as well is too busy to be able to give his personal attention or to see everything that happens. Something ultimately has, however, to be done to stop the waste. A system of examination of tools must be instituted when delivered from the tool storage to the operators at the different machines, or when received from them at the completion of each job, and any ill-treatment of them carefully noted.

Features of Successful Operation.

The successful operation of any tool employed for the boring, facing and cutting of screw threads, and this is equally true of forming tools, depends on their proper grinding and sharpening. In many plants all tools are kept in a well-appointed tool-room, and there cared for by experienced mechanics, the machine operators not being allowed to grind or otherwise make changes. This work should all be done in the tool-room, and under such conditions there is seldom cause for complaint. One of the best remedies I can recommend for the present abuse or tools is better factory organization, which places the proper care of all tools and machines in the hands of a competent person in a well-equipped tool storage room.

Employees' Instruction Book.

Another remedy I would suggest is a book of instructions, which should be issued to every man entering or already in the employ of the company, entitled "The Proper Care of Tools and Machines." I have seen this applied in a large brass manufacturing plant employing 900 men, and good results have accrued. A wise man will learn and will increase his learning, but fools despise wisdom and instruction. The contents of a book of instructions in an employee's hand at all times will eventually get to his mind, and there is less liability of his abusing tools or machines. This book could be made about 3 x 5 inches in size, and after the introduction and reasons for its existence, it should contain the following:

Before beginning work, a workman should carefully examine all tools when received by him from the tool-room, and report to his foreman if they are not in first-class condition. If he fail to do this, such defective tools must be charged against him.

Oil your machine all over the first thing in the morning, as it works more satisfactorily.

Under no conditions use a file as a hammer, chisel or a pry.

Don't use a monkey wrench for the same purpose as a hammer.

A wrench used on the head of a bolt, or, in fact, anything that has a square,

must fit this square closely or it will gradually round off the corners.

When the chucks are put on the spindles of lathes or other machines, be sure that the threads on the spindles and in the chucks are cleaned of all chips and foreign matter, and oiled. Screw on the chuck by hand one-quarter turn of the spindle, and then give it one quick turn with the hand against the shoulder, which will tighten it sufficiently to keep it in place without causing trouble when it is taken off.

At least once a week the box-chucks should be oiled in their working parts, and when using collets see that all chips are out of the spindle of the lathe as well as the thread on collet before screwing it in.

When putting jaws into a chuck, both jaws and chuck must be free from chips. The chuck should be opened up wide enough to allow the hand to pass in under the false jaws. Next start the screw into the jaws and screw it up as far as possible with the fingers. After inserting both jaws in this way, screw up the chuck until the false jaws come together and press firmly into the tongue and groove.

This will release the chuck screw enough to allow you to tap on the face of the jaws with a piece of lead for the purpose of making them set even on the front face. Never use any hard material for this purpose, because it will mar the face of the jaws. After this is done, screw up the chuck screw until you have firmly grasped both jaws, then screw up both jaws tightly with a screwdriver.

All working parts of the tools should be kept well oiled. The shanks of the tools should be oiled and wiped lightly before inserting, so as to keep them from rusting if they are left in the machine for any length of time. All holes in the turret of a machine not occupied by tools should be kept plugged up with wooden plugs, so that chips will not enter and get into the working parts.

Gauges and templets of all kinds must be handled with care.

Never force a piece of work into a gauge.

Don't slip a ring gauge over a set screw on your machine, for the jolting or jarring of the machine will cause it to work on the set screw and eventually ruin it.

Threaded plug or female gauges should be screwed into a plug or socket to act as a protector for them when not in use and to avoid any damage to the threads. Never accept a taper shank drill from the tool-keeper when it has a broken or distorted tang. It may become loose and damage the socket.

When taking the chuck jaws out of a chuck, loosen the screws in the jaws, and, if they still hang tightly, insert a screwdriver into the chuck and pry open the jaws, which will loosen them.

Do not start a machine without knowing that everything is ready.

Do not do any unnecessary hammering on a drill-press table.

Always avoid doing any hammering on a machine if it can be possibly avoided. Do not hold a tool of any kind on an emery wheel until it gets blue.

Do not run a machine when any part of it is out of order without notifying your foreman.

Do not forget that a cutting off tool should have equal clearance on both sides, and do not blow filings or chips in among the running parts of a machine.

Tools should not be forced into a turret of a lathe, for the reason that it is very difficult to remove them after they have been so treated. Then, too, there is danger that the hole will be enlarged after frequent use, which would make it unfit to use with the regular tools.

Tools should fit in loosely, so that they can be inserted by hand. If the tools do not fit in this way, the foreman must be called, and he should see that they are made to fit properly. Always see that your tools line up on center when starting a new job.

If a tool becomes fast in the turret be sure that you do not injure it or the machine in trying to remove it. Try some of the following rules, and if your efforts do not meet with success call your foreman.

Treatment of Miscellaneous Parts.

Centers.—If after loosening the set screw you are unable to remove the center by hand, take a block or bar of lead and tap it lightly. Do not rap or pound too hard, as you are liable to strain the center. If there be a flat on the center, you can use a monkey wrench to give it a turn. This applies to centers in monitor lathes only. Centers in spindles should be driven out with a rod put into the hollow of the spindle.

Tool-holders.—These should be treated the same as centers, except that you can generally get a monkey or stillson wrench around the holder to the set screw in order to give it a turn, or use it at the back so as to act as a wedge and force it straight out.

Tap Holders.—The last piece of every job should not be taken out of the chuck until you have tried to extract the tap holder from the turret. If too tight to remove by hand, the tap in the holder should be screwed into this piece of work. Next loosen the set screw holding the tap holder in the turret, run the carriage back and pull the tap holder out of the turret. This same rule applies to the adjusting of the tap holder in or out of the turret when adjusting it to work in connection with the templet.

Die Heads.—The above also applies to die heads. The last piece of a job should also be saved until you have determined that you can take out the die head by hand. If too tight for this purpose, run the die head onto the thread, hold the lever of the die head so that the chasers will not open up, then run the carriage back so that it is pulled out of the turret.

Chasers.—A bar of lead or a piece of wood should be used to tap lightly the chasers, so that they can be extracted from the die head if they are wedged in.

A wrench, hammer, or any hard material, such as brass, iron or steel, should never be used to adjust your tools in the turret, even to a fraction of an inch. Tap the tools lightly with a bar of lead whenever necessary. No hard material of any kind should lie on the bed of the lathe. The bed or shears should be covered with a smooth board. When putting a tool in the turret or holder, special care should be taken to turn the flat side of the shank, so that the set screw will set on it. If the set screw is screwed down on the round part of the shank it will spread it out and cause a lump to appear or even cause the shank to bend in the hole. The set screw should never be allowed to rest on the extreme end of the shank, for it will tip the tool out of center and allow it to creep from under the set screw and ruin the end. Always use square hard wood or lead block when taking off a box-chuck from the spindle.

Do not be contented with just knowing what shop kinks you have learned from this or somewhere else, but investigate and work out a few for yourself.

Keeping Down Investment in Raw Material Purchases

By E. W. Mackenzie *

This article shows how an up-to-date firm organized a department whose duty was to keep close watch on the stock, thereby enabling the purchasing agent to specialize entirely in the art of getting the most and the best on the market for the least money.

OF THE many questions with which managers of manufacturing concerns are battling during the present financial stringency, possibly no other is receiving more attention than the reduction of investment in raw materials without tying up one or more departments. If the factory has not the services of a department to look after that end of the business, this question becomes the nightmare of the shop foremen and the bugbear of the purchasing agent. The manager explains to his purchasing agent time after time the importance of reducing all purchases to a minimum, and on each occasion that the purchasing agent receives a requisition for material, he must know positively that there is nothing in the plant which can be utilized. This article is not written, however, to give in detail the troubles of a purchasing agent, and how he fights them out, but with a view of showing how one up-to-date firm took this responsibility from him and organized a department whose duty it became to keep a close watch on the stock and thereby give the purchasing agent the opportunity of specializing in the art of getting the most and the best on the market for the least money.

One of the contributory causes for the organization of a department to relieve the purchasing agent of this responsibility was due to the fact that previously material had been purchased and machined in such large quantities that storeroom space was sacrificed and large investments incurred on articles which were likely to be rendered obsolete because of new designs, or because stock was not kept in sufficient quantities to allow orders to be filled completely and efficiently. After all the various phases of the situation, both for and against, had been considered, it was finally decided that a department to regulate the amount of stock carried on hand and to see that material was ordered through the shop and placed in the warehouse ready to meet shipping orders, would more than pay for itself in the course of time.

Organizing Department.

The department organized was therefore termed the Stock Accounts Department, and was composed of what is commonly called a production foreman or engineer, together with the necessary number of clerks. The head of this department reported only to the works manager, and it might be well to say that his duties were to see that proper records were kept of every commodity in the plant; to keep a perpetual inventory of all material, whether purchased or manufactured; to see that orders were issued to each manufacturing department of the factory and to requisition on the purchasing department all purchased material.

Stock Inventory.

One of the first things to be secured was an inventory of all the stock and material, and after a careful inventory had been taken, including that which was in the raw state, in progress, machined and assembled, the stock ledgers were charged with same. A stores department was then organized for the purpose of keeping all raw and finished material in a specific place from which the stock could be disbursed as fast as orders were received. After these details were completed, instructions were issued to have all stock turned into the stores department, with the exception of that in the course of machining. As fast as this material was received into the stores, it was sorted out either according to size, number or symbol, and then placed in bins, which were labeled, numbered and indexed for ready reference, on cards supplied for the purpose, and these records were then transmitted to the office for the benefit of the stock accounts department.

It soon, however, became apparent, in order that the stock accounts department might order intelligently, that some official lists, including every item of material used in the assembly of a complete article, must be secured. The work of compiling these lists was handed over to the engineering department, they in turn supplying lists to the stock accounts, cost, stores and small assembly department, which set forth in detail all material required, and also the drawing and manufacturing symbols or numbers.

Whenever any changes in design or otherwise were made on the completed part covered by any list, these lists were recalled by the engineering department, the changes made thereon, and again returned to the various departments. It should also be added here that before any immediate changes in design were ordered which would make obsolete all stock on hand covered by a change, information was always secured from the stock accounts department as to the amount of stock on hand that would be affected by the change. This was followed out in order that a date could be set which would allow all stock being used which was on hand, and not necessitate its being scrapped or carried as repair stock in large quantities for any length of time and thereby have a large investment lying around.

In order that a proper check would be received in the stock accounts department of all stock and material delivered from the stores department, every employee was required to produce a written order signed by his foreman or by someone in authority, this order showing the number of pieces required, the weight, length or other unit of measurement, the size, symbol and description of the article required, the department desiring these supplies, and the bill of material or order number on which the stock was to apply. At the close of each day these orders or requisitions were turned into the stock accounts department, and all material appearing on same would be charged to the department to whom it was delivered and credited to the stores. After the stock accounts department had priced and entered up all the information in the ledgers, these requisitions were then to be turned over to the cost department for figuring and later on filed according to date for ready reference in case of dispute.

As a daily report of all the material and stock added and placed in the stores department was necessary in order that the stock ledgers might show from day to day the actual amount of stock on hand, the receiving department was required to forward a duplicate copy of their report to the stock accounts department. From this report the ledgers would be charged with all stock purchased, and this stock would then be applied against that on order. On manufactured articles a list similar in a great many respects would be forwarded from the stores department, showing the quantities, sizes, manufacturing numbers of symbols and the order on which they applied.

Anticipated Sales Provision.

To secure an official list of the articles to be manufactured for the purpose of ordering supplies and stock through the shop, an itemized list was secured

*Canadian Safety Engineering Bureau, Toronto.

from the sales department each week showing the shipping orders on hand and the amount of goods required, together with the time allowed on each order to produce the goods. Along with this, the sales department furnished a list showing their anticipated sales covering a period of twelve weeks. As all articles of manufacture were ordered through the shop in what may be considered units of manufacture, these units representing groups which could be placed on the erecting floor most conveniently and completed at the end of each week, the articles on the lists received from the sales department were accordingly grouped into units of manufacture. To each unit was assigned a number, and this number afterwards served for identifying the group. A list would then be made up by the stock accounts department showing the articles on shipping orders together with the unit number, while the position of the unit would show its relative importance on the list and attention accordingly given it in the shop and office. In cases where the stock already was in the warehouse covering an order, this would not then be shown.

Delivery Schedule.

As new orders were received from week to week and added to the schedule, it was continually changing, and the relative importance of each unit was accordingly changed. It became necessary, therefore, in the interest of economy and manufacturing conditions, to make the first three weeks fixed on the schedule—that is to say, whenever ar article through the sales department's requirements had been placed within the bounds of the first three weeks, it could not be replaced by any other article of similar importance except in very urgent cases.

A copy of this schedule was placed in the hands of every department of the plant, and all work was gauged and put through with the end in view of having all stock machined and ready for assembling by the time any article was ordered assembled and with only such stock manufactured and carried as would cover twelve weeks.

In ordering material on the purchasing department, the stock accounts department would order only such material as would be necessary to cover the schedule. This material would then be requisitioned on forms which were numbered consecutively, and as the requisitions were passed over to the purchasing department for ordering, they would be entered on the ledgers. As fast as the purchasing department ordered the material, the duplicates of the orders would be forwarded to the stock accounts department and they in turn would apply them against the requisition number, thus showing that the requisition had received the purchasing department's attention and that the stock was ordered.

On ordering material machined through the shop, all departments who had work on a certain article would receive an order which was numbered in accordance with the set of numbers assigned to any one department, thereby assisting the cost department in posting labor to the orders for any one department. In every case, the cost department would receive a copy of the order for cost purposes. All labor being performed on the material covered by an order would be identified on the daily time cards according to the number of issue, and labor and expense items would be posted to the cost department's copy of the order, thereby making a complete cost record. These orders would show the date of issue, the symbol or part number, material made of, the sketch or drawing number on which the specifications for machining could be secured in the engineering department, the number of pieces required to the modification on which it was to apply, and the manufacturing unit number.

The stores department would also receive a copy of all the orders issued to the various manufacturing departments in order that they might have advance information of the quantity of stock passing through the shop, and to allow time for the preparation of storage room. The information contained on the order was always entered up on the stock ledgers, and the order then placed on the files in the department. The number of issue served a dual purpose for the stock accounts department, i.e., calling for an inventory of similar stock in the stores department and thereby overcoming discrepancies which might enter into the records, and, in addition, recording all orders issued for new stock.

Engineering Department Responsibility.

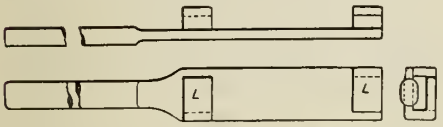
In a great many cases it was found convenient and economical to have the engineering department furnish subsidiary lists of small assemblies which went to make up an outfit or completed article. This was followed out in order to facilitate the handling of material in the stores department and with a view towards training the mechanics to become specialists along certain lines, by having certain employees assembling parts of standard articles constantly. Copies of these subsidiary lists were furnished to the small assembly and cost and stock accounts departments, and all orders issued to the small assembly department would call for a certain number of articles assembled according to the specifications shown on a specific list. Whenever the stores department delivered material to the small assembly department for assembling or fitting, the material was always disbursed according to that called for on the lists, and in this way a standard practice was thereby established and all responsibility was placed with the engineering department for the right material entering into the assemblies. After the material had been delivered, the stores department's copy of the order was forwarded to the office, and noted thereon were any shortages of stock. The stock accounts department would then credit the stores department with all the material disbursed, with the exceptions of that as shown short on the order. The shortages were then investigated and means taken for immediately overcoming them in order that the work might not be delayed in completion. On the final assemblies in the erecting department the same procedure was carried out.

The factory was enabled to work up stock as was required on each individual manufacturing unit through the use of unit shortages. Each unit shortage was made up in the stock accounts department, and revealed the number of parts that were short according to the ledgers on each manufacturing unit. It also bore the order or bill of material number and the department or departments who were holding these parts up. Copies of these shortages were then forwarded to each department concerned with a shortage, and a copy was also sent to the factory superintendent. These reports were checked up daily by a clerk whose duty it was to carry this out, and after they had been revised they were again returned to the various departments.

Results of Operation.

At inventory time, one year after this campaign to secure absolute control over all stock on the plant, the inventory figures revealed the fact that the value of stock carried was a good many thousands of dollars less than had been carried during previous years in comparison with the volume of business handled in similar periods. The efficiency of each department was increased by a large percentage due to expending energies along specific lines. Each foreman was kept constantly in touch with each department of the plant, and especially his own, with regard to the work required of him to meet shipments. The factory superintendent had records at hand constantly, and he was enabled through these shortages and through the general system of handling the work to increase or decrease the number of men required in each department, thereby keeping the distribution of work uniform and the efficiency of each department up to standard.

The system obviated the necessity of hunting up work for departments to keep the men busy or the overcrowding of other departments.



PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

USEFUL WRENCH EXTENSION.

By G. G. Jacion.

THE cut herewith shows a very useful tool in its place, so simple as to be very little used. It consists of a flat bar of machine steel with handle and

USEFUL WRENCH EXTENSION.

lugs L L forged on. This extension with a litttle offset to accommodate double ended wrenches can be applied instantly to any kind of spanner to turn in either direction. It will be found very convenient to work the nuts down with the ordinary wrench and to apply the handle simply to tighten them up.

REPETITION MACHINING OF SPRING COVER PLATES.

"Werkstattstechnik."

The device illustrated in Figs. 1—4 serves to hold pieces of various sizes which have to be bored and machined in a turret lathe. The cast iron plate A is centered by B in the chuck or the face of the lathe, and the slide C is adjusted and clamped by the bracket G and bolts I through the upper guide bar. The work is held by the jaws E E, the form of which secures the centering. Rigidity is ensured by the wide-set guides in CF for EE. The right and left threaded spindle F carried by G moves EE symmetrically together or apart. A divided bush finely threaded at each end is placed over a pin between two collars at the centre of F so that the latter can rotate, but not move axially. The bearing G is then put in place and fixed to C by H. Ring nuts J hold the divided bush firmly to the bearing bracket, but permit that axial adjustment of the bush and spindle required to center the jaws EE in the side.

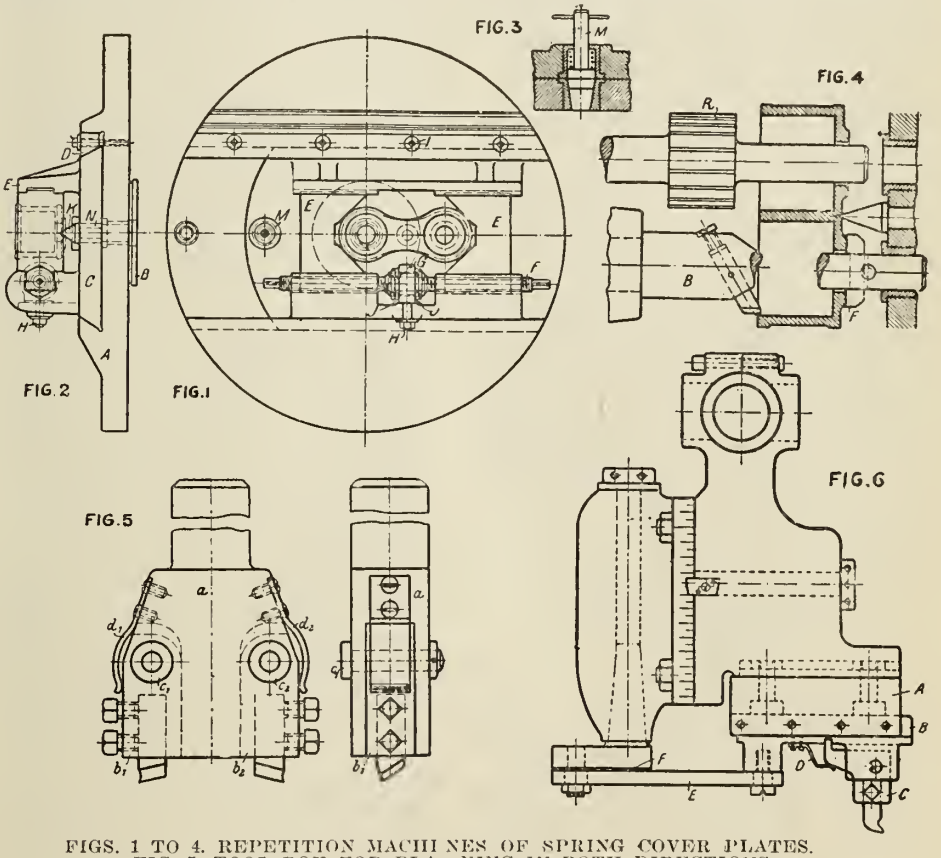
The holes in the bottom of the piece are bored one after the other, the successive positions of the slide C being determined by the spring-pin M engaging in correctly placed hardened bushes in A. The slide is fixed during working by tightening the bolts I. The large bore of the shell is machined by a boring rod guided in the bush N (Figs. 2 and 4). The nave is machined by the same rod and the knife F; a longer tool being used to machine the front rim. The reamer R the spindle of which is guided by N, is used to complete the boring.

TOOL BOX FOR PLANING IN BOTH DIRECTIONS.

"Werkstattstechnik."

A double tool box construction permitting planing to be carried out in both directions, and thus eliminating the idle return stroke of an ordinary planing machine, is illustrated in Fig. 5. The tool holders b1, b2 are pivoted on spindles c1, c2 in the shell a and provided with rectangular holes for the reception of planing tools. The spring d1 or d2 and the resistance encountered by the tool when cutting sets the latter firmly against its seating on a. During its own return stroke (when the other tool is cutting), each tool is lifted against the spring d1 or d2 so as to clear the work. The shell a is forged in one piece with the stem which carries it. Cutting takes place during each stroke, and the tool box must be traversed after each stroke unless a second rather lighter cut it taken over the same line during the return stroke.

SLOTTING ATTACHMENT FOR MILLING MACHINES.



"Werkstattstechnik."

The slotting attachment illustrated in Fig. 6 is used with the vertical milling apparatus of an ordinary horizontal milling machine. The saddle A of the slotting attachment is bolted to the T-slotted surface of the vertical milling attachment. The piece B slides in A and carries the tool box C which is pivoted so that the tool may ride freely over the work during the return stroke. A spring D returns the tool box to its vertical position before the cutting stroke is commenced. Reciprocation of B is effected by a connecting rod E and crank F, the latter being carried by a conical shaft in the spindle bearing of the vertical milling device.

HINTS ON DRILLING.

By Armley Leeds.

Few operations on shop tools are more frequently disappointing than the grinding and sharpening of drills. In shops where every operator grinds his own drills, more work is spoilt and drills broken than on any other machine tool.

FIGS. 1 TO 4. REPETITION MACHINES OF SPRING COVER PLATES.
FIG. 5. TOOL BOX FOR PLANING IN BOTH DIRECTIONS.
FIG. 6. SLOTTING ATTACHMENT FOR MILLING MACHINES.

There are very few shops that do not possess a drill sharpening machine, but if left to the drill operator to choose this or the grindstone, he invariably chooses the latter.

The cutting edges of drills should have a proper and uniform angle with the longitudinal axis of the drill. They should be of exactly equal length, and the lips of the drill should be well backed off or cleared. If the clearance is insufficient or imperfect it will not cut. When force is applied it resists the power of the machine and is crushed or split.

Drills properly made have their cutting edges straight when ground to a proper angle, which is 59 degs. Grinding to a less angle is likely to produce a crooked and irregular hole. This angle is an index to the clearance. An effective method of determining the clearance is to set the point of the drill on a plain surface, holding a scale alongside. By revolving the drill, its clearance is shown, as well as the height of the cutting lips which should be equal.

When commencing work, run the drill for one or two holes at a slower feed and speed than those at which you intend to work. This enables the drill to warm up and is better than putting it immediately into heavy work. If the points of a drill become blunt or the cutting edges break away or chip, there is too much feed, and if the tendency is to wear away on the periphery, it is running too fast.

As the drill is shortened through use, the center shows thicker and will work harder in drilling. The reason for this is that a drill may be of sufficient strength to resist the torsional strain to which it is subjected in use, without being at the same time so thick at the point as to require excessive force to make it penetrate its work. The grooves being of increasing depth from the point to the shank, and the centre should be thinned to overcome this, care being taken to remove an equal amount of stock on each side, and to keep the point central. In grinding a drill the original form should be preserved.

ECONOMICAL WORKING OF MACHINE TOOLS.

By S. M. L.

Not long ago the manager of one of our large machine building concerns walked into the shop escorting a man who had a remarkable new high speed steel for sale. The foreman, after being duly introduced, prepared a powerful lathe to give the sample steel a tryout.

The test seemed to be a success; the manager was impressed; he admitted that he had never seen such a quantity of blue chips coming off in that lathe before, and left the shop in company with the demonstrator. The next day as the manager was making his rounds, the foreman quietly called him to the scene of the test of yesterday. The operative was making blue chips at the same rate as before, but with ordinary high speed steel. Seeing the manager interested, he replaced the tool with another of the same quality steel, increased the depth of cut and doubled the feed. The chips came off only slightly discolored and in lengths of convenient size to fall into the turnings box. The machine worked so quietly that it was difficult for the foreman to convince his superior that he was really doing more work with less power than before. The generosity of modern machines in furnishing power has caused the economical removing of metal to be somewhat lost sight of. The best steel is often that which is in the hands of the best man.

MANUFACTURING IN QUANTITY.

By A. E. S.

The ideal article for manufacturing purposes would be one that is favored with an unlimited market as far as the plant is concerned, and liable to no changes in design or construction from time to time. The absolute specialization of plant and machinery would thus permit of savings impossible by any other means.

Under these conditions, the machines operating on a single piece are divided into units or sets, the capacity of each element of which would be measured by the time necessary to perform the shortest operations. Thus, a set might consist of two machines for the first operation, four for the second, and one for the third in order to keep the work steadily progressing. If the capacity needs to be increased, it is usually accomplished by adding a complete unit. This permits true progressive or team production and as the different parts are to be used as fast as made, comparatively small storage capacity is required. The greatest engineering difficulty with this system is the keeping of every element working to its capacity and still maintaining a well balanced production.

The batch system which is the most used in Canada, can, by the exercise of care and capable management, be brought to a surprisingly high state of efficiency. It consists in the use of a semi-special class of machines so arranged as to be readily convertable for different operations. Storage and handling capacity is required for at least a complete batch of components, the larger the lots, of course, the better.

The dangers of this system are shortages and errors, and it is quite unlikely that an error once committed will be found out until assembling, when it will probably be discovered that a complete batch of parts has been spoiled. The essential, and so far, the only successful method of preventing these losses is the preparation of perfect individual and assembled samples. The man setting up the machine for the production of a certain piece should not only be provided with sample, gauges and templates, but his product should be periodically tried to the sample assembly. Care at this point of the manufacture not only facilitates assembling operations but will prevent the greatest loss arising from this system, that due to wrong sizes and shapes in large quantities of components.

Locomotive Boiler Tube Failures.—Writing on the subject of locomotive boiler tube failures, an engineer, whose work consists very largely of inspecting boilers of various kinds, raises the question as to whether it is advisable in the interests of safety to employ welded superheater tubes. To the men on locomotives, he says, the collapse or failure of one of these large tubes amounts to about the same as a crown plate failure, because in either case death or serious injury is almost certain. Therefore, if we are to have the same number of failures of superheater tubes due to welding that now occur with the smaller tubes, the injuries resulting therefrom will, owing to the increased size of the tubes, doubtless be so much more serious that, in the interests of safety, action will possibly have to be taken even to the extent of prohibiting welds in such large tubes. Many shops wherein tubes of this kind are manufactured and fitted are poorly equipped for handling the work. Adequate tests of welded tubes are in many instances not being made, and, as might be expected, there is a wide divergency of opinion as to the best method of doing such work. That the strength of a weld is practically an unknown quantity has been demonstrated times without number, and for this reason it is generally recognized in practice that where the highest degree of efficiency and reliability are required welds are prohibited.

Articles attacked by rust are said to be conveniently cleaned by dipping them in a well-saturated solution of stannic chloride, 12 to 24 hours sufficing according to the thickness of the rust. An excess of acid in the solution must be avoided. After the objects have been removed from the bath they must be rinsed with water, then with ammonia, and quickly dried. They are then said to resemble dead silver.

MODERN MACHINE SHOP PRACTICE.

By H. Womersley.

IN modern workshop practice there are opening up slowly but surely large opportunities for procuring greater accuracy in machine and engine parts, and it is my purpose in this article to indicate directions from which we will be able to produce a better finished article at less cost than heretofore.

The aim of every engineer ought to be to obtain the best work in the shortest possible time, and at the lowest labor cost.

In a modern shop fine turning is no longer necessary or desirable; it is a waste of time.

Our industries are losing much because the foreman has to assume the intelligent guidance of workmen who, through prejudice, doubt, or fear, now rob us of the great economies due to modern methods.

In many modern shops there is often a lack of co-operation between departments; but each succeeding period gives us more exact knowledge, while an ever-increasing amount of data is being obtained, which makes it easy to eradicate the weak spots.

Grinding.

To my mind no machine shop practice has made such an advance in recent years as has that of grinding. Undoubtedly, every up-to-date shop has its grinding machine. Modern requirements call for grinding. To-day the intelligent use of grinding wheels and machines is yielding large returns in many workshops, but there is still room for further study of this feature which will amply repay those who give it their consideration.

The grinding wheel as now made is a milling cutter with millions of cutting teeth, capable of cutting at a great speed. When mounted on a good machine it can be used at a cutting speed of 6,000 feet per minute. It is thus able to remove metal from certain forms of work more quickly than the milling cutter.

To mill different materials and obtain desired results the rate at which the machine is operated naturally has much to do with the quality and quantity of the work. For milling only three factors have to be taken into consideration—the depth of cut, surface speed of cutter, and the rate of feed of work. An additional factor, however, is brought into grinding that complicates the process somewhat. The work itself revolves and, of course, this has to be considered as well as the factors which correspond to those in milling.

Taking the milling machine again as an example, we know that wide ranges of speeds and feeds are required where there is a variety of work. Grinding is nothing more nor less than a milling operation upon a very fine scale, in place of the comparatively few points on a milling cutter, there being millions of points on the surface of a wheel. Hence it is evident that wide ranges of speeds and feeds are also essential in the grinding machine if the best results are to be obtained.

All users of grinding wheels recognize the great increase of efficiency in these tools during the past few years. Not many years ago, grinding was regarded as an expensive operation to he employed only where great accuracy was required, and as little stock as posible was left to be removed by the grinder. With the advent of more efficient wheels and mamachines it has been found economical to merely rough-turn the work in the lathe, and then pass it to the grinder to size and finish. Sometimes rough-turning is dispensed with, and the work is ground directly from the rough bar. It is hard to find records of the weight of stock removed by the old-fashioned emery wheel. Ir modern practice, wheels will often remove from two to three cubic inches of steel per minute.

Grinding Pointers.

When a wheel glazes it may be that the speed is too high, and when it wears rapidly the fault may be because it is running too slow. In such cases it is usual to correct the fault by changing the wheel. To secure the best results, the same surface speeds should be maintained as the wheel wears down. Complaints are often made that wheels get softer towards the middle, this being due to the slower surface speed, which causes the particles to wear away faster.

Wheels should be run towards the operator. Never crowd a wheel, as it will not cut any faster, but will simply heat the work, and wear itself out sooner. Never back a wheel, as it may be broken or so cracked as to break in use. Keep your wheels perfectly true and in balance, and dress them up a little each day.

For automatic grinding the harder the material to grind the softer should be the wheel; also the larger the surface of contact between the wheel and the work, the softer should be the wheel. A softer wheel is therefore needed for work of larger diameter than for small, and for surface grinding than for cylindrical grinding. The surface of contact is partly determined by the diameter of the wheel, so a small wheel should be harder than a large one for the same kind of work. Similarly a thin wheel should be harder than a thick one.

In cylindrical grinding, the finish depends upon the speed of the work, the speed and condition of the wheel, and, to a less extent the fineness of the wheel. A good commercial finish may be had with a wheel as coarse as No. 36, provided it is true, although misunderstanding exists as to just what constitutes good commercial grinding. Contrary to the common belief, work having a polished appearance is no more accurate than that having a dull appearance, and much valuable time is lost in obtaining it. For all commercial purposes, work finished to size and free from chatter marks is satisfactory unless for some special reason a polished surface is required.

Concluding, I would say that when the knowledge of grinding becomes more common, and the opposition to increased production on the part of workmen has been overcome, the field for grinding will be still more extended. The operator, by education and training, will help this field of grinding to a successful issue.

There are other fields of large promise in machine shop practice, but none excel that under discussion for it has become so extensive that it is difficult for one's brain to master the whole art. On every hand there is a demand for men who have digested the greatest amount of information in this direction. No attempt has been made to give the last word in this great subject; in fact little more than a surface scratch has been made, but it may be sufficient to establish a line of thought that will accomplish great things for those who allow it to possess them.

MODERN TRANSPORTATION—ELECTRIC TRUCKS.

As a contributor to technical publications in Paris, France, as well as automobile designer and builder since the work first started there, permit me to contradict Mr. D. Watson's conclusions in the following brief remarks, dictated by now 20 years' experience in automobile lines.

The principle advantage of automobile transportation is speed. If you can

go quicker than another, the other fellow is handicapped, and cannot succeed as well as you. Early birds get the worms. This alone would be enough to give the palm to gasoline trucks even if they need "the man born with a monkey wrench in his hand"! We grow that class of men in the old countries, and it is easy enough to get some seed. I have imported a lot, into Montreal, it thrives well, and has given many offsprings in a few years. Canadian soil is first class for the plantation. If Canada were to get behind the time, it would be a new era in Canadian affairs, I am sure. The main point in Mr. Watson's argument is not reasonable in Canada; smart "boys" being all over the country, willing and able to do the necessary job in a twinkling. The following points, however, Mr. Watson does not say a word about.

The Deadweight Feature.

Deadweight in electric trucks is about 2-3 of the total load, on account of the storage battery.

Deadweight in gasoline trucks is not over 1-3 of total load.

This means that to carry the same load in the same time (difference of speed not taken into consideration) three electric trucks are necessary to do the work of one gasoline truck. If speed be considered, in many cases, five electrics will be needed instead of one gasoline truck. Think then of the money invested, fixed charges, labor cost, and other items which would take too long for me to go into in this refutation, and judge for yourself.

Range of Delivery.

Range of delivery with electric trucks is very limited.

Range of delivery with gasoline trucks is unlimited.

This comes from the fact that storage batteries in electric trucks can but do the work their energy storage is calculated upon to do, and even in practice, it is well to reserve 20 per cent. under the calculation. If that "teamster" knows nothing about storage batteries, as Mr. Watson puts it, it is almost certain that the range of delivery of his electric truck will be curtailed by 30 per cent., and also that much damage will be caused to said battery ere said teamster gets home. Anyhow, a 45 to 50 miles range of delivery is a good average for the electric truck; it must be home then to lose time in reloading the storage battery; time which is money of course.

The gasoline truck starts in the morning with a load of goods thrice as heavy as the electric, and its range is unlimited, since the driver may buy gasoline anywhere on the road, and he gets home, having bothered no one at the stores in the daytime, having cleared the stores floor in the morning and made room for the sorting of more goods to be shipped away next morning. This is an advantage that made progressive Europeans settle the question of electric versus gasoline, by putting aside electric trucks altogether, some seven years ago. Why Canadians can be induced to make the experiment I fail to see, and it is to serve their interests, I am writing these lines so that they will judge for themselves.

The Tire Feature.

Roads are no better for electric trucks than for gasoline trucks. The wear and tear of tire is function of the mileage run, of the weight transported, and of the building of the car. Since to deliver the same weight, it takes electric trucks three units to one unit gasoline truck, from that sole standpoint the consumption of tires will appear three times as great in the expenditure of tires on the same mileage.

In practice, gasoline trucks seem to spend more tires than electric but this is due to the fact that comparison is made between one electric and one gasoline truck, irrespective of weight transported, and mileage run. In reality, on chosen roads, constantly on the flat, from experiments made in Paris, France, the expense of tires as between electric and gasoline trucks showed a ratio of 1 to 3, the latter being recorded against electric. The design of the truck (gasoline) counts also for much in the expenditure of tires. You see on the roads trucks with small wheels and others with large wheels. It would take too long to explain why differences in wheel sizes make a very big difference in the quality of motor cars and trucks in particular, but everybody will readily understand that running over one mile will necessitate fewer revolutions of large wheels than will be the case with small wheels. The rubber on large wheels will come less often in contact with the ground than in the case of small wheels, and the result will be that tires of large wheeled trucks will wear out less quickly than tires on small wheeled trucks. Such details are not taken into consideration in this country yet, but in time they will because it means much in the expense of tires.

Electric trucks are generally large wheeled, and maybe this is why expenditure in tires appears higher to Mr. Watson in gasoline trucks, those of American make, being mostly low wheeled, though the automobile building companies, whose make of touring cars are reproachless, also build reproachless trucks, their engineers being thoroughly imbued with real automobile principles.

Six or seven companies in the United States are producing cars and trucks in line with the highest scientific standards of Europe, but the majority of builders on the American side of the frontier, build not for a reputation, but for pure commercial purposes, with the result that they are led to wheeling their trucks low, because it costs money to wheel high, and they are in business for competition. The difference in mechanism for high wheeling is one-quarter of total cost of said mechanism, and to this comes in addition, one-third more rubber on each wheel, that is to say close upon $150 for that item alone. Customers, or I should say users of trucks do not take that in consideration when purchasing a truck, but they pay for it dearly in the running of it. Mr. Watson is probably comparing high wheeled electric, with low wheeled gasoline trucks, but even there, the difference is in favor of gasoline driven trucks.

Repairs and Depreciation.

Repairs to electric compared with gasoline trucks should not prove higher on one side than on the other, if first-class gasoline trucks are used, because builders of the first class gasoline machines use everything of the highest and best quality, and it is seldom any important part proves defective, while they are all made to last many years.

What about the short circuit in electric storage batteries? Does this happen or not? When a short circuit is formed in a battery, is it not the end of it as a rule, and what of its cost? I will not say that it happens with all electric storage batteries, but 50 per cent. of them are one day or another victims of that particular trouble.

In well organized transportation concerns, there is no more repair work required on the electric than on the gasoline truck, because attention and care is at the root of the organization, but for a firm having a couple or so of trucks, no particular organization can be got either for the one or the other, and there are great odds against the electric which do not exist against the gasoline truck, so far as repairs and depreciation are concerned.

—⚙—

Equal to the Occasion. — Peals of laughter came from the president's room as the secretary stepped out. "Mr. Green is too busy to see you at present," said the secretary politely. "I'm sorry," said the man who had called on business. "Will you go back and tell Mr. Green that I've got two stories just as good as the one he's heard, if he'll let me in to tell them?"

Series of Practical Questions and Answers for Mechanics

Every care is being taken to include only pertinent practical questions, and give same direct, reliable answers. Catch questions will be avoided. Attention is drawn to the alternating course in arithmetic, a concurrent study of which is recommended with that of the Question and Answer Series.

RELATING TO STRENGTH OF MATERIALS.

THE most common formula in strength of materials is that used in connection with beams of all kinds and is $\frac{M}{S} = \frac{I}{C}$. This is an extremely easy one to remember, and will well repay any mechanic or draftsman's effort. The manipulation of formulae is important, and is really the aim of the study of algebra. However, by a very little application and practice with simple examples, anyone can handle the formulae met with in the average technical reading.

The above formula, and any other for that matter, is merely a statement of the relation that the different factors involved in a calculation bear to each other. Thus, should we desire to find M, the other three quantities being known, the formula $\frac{M}{S} = \frac{I}{C}$ would become $M = \frac{I}{C} \times S$, and likewise $I = \frac{M}{S} \times C$; a strong similarity. $S = \frac{c}{I} \times M$, and $c = \frac{S}{M} \times I$, another striking similarity. Notice the difference in dealing with multipliers and dividers, those above the line and those below.

* * *

Question.—A 75-ton hydraulic press is supported by four 2-inch round steel bars. What is the unit stress in the bars when the machine is working to capacity?

Answer.—Area of cross-section of a 2-inch round bar is $2^2 \times .7854 = 3.1416$ sq. in. Total area of four bars is $3,1416 \times 4 = 12.5664$ sq. ins. Total load distributed over this area is $75 \times 2,000 = 150,000$ lbs., or stress per sq. in. in bars $= \frac{150,000}{12.5664} = 11936.6$ lbs.

* * *

Question.—It is found, by means of vector diagrams, that the load on a tension member of a bridge truss is 107,000 lbs. This member must be made up of three bars 1 inch thick. Considering the ultimate strength of steel to be 60,000 lbs. per sq. in. and adopting a factor of safety of 5, how wide should these bars be?

Answer.—Total load is 107,000 lbs. Allowable working stress is $\frac{60,000}{5} =$ 12,000 lbs. sq. in. Cross sectional area of steel necessary is $\frac{107,000}{12,000} = 8.916$ sq. in. The width of bars necessary then would be $\frac{8.916}{3 \times 1} = 2.967$ inches, or say 3 in.

* * *

Question.—A steel sounding wire $\frac{3}{8}$ in. in diameter has a tensile strength of 110,000 lbs. per sq. in. What weight would it support a mile below the surface of the sea?

Answer—The area of the cross-section of the wire is $.375^2 \times .7854 = .1104$ sq. in. This would support a load of $110,000 \times .1104 = 12,144$ lbs. One mile of wire at the rate of .376 lb. per foot weighs $.376 \times 5280 = 1985.3$ lbs. The volume of water displaced by the wire would be $\frac{.1104 \times 12 \times 5280}{1728} = 4.05$ cu. ft. Its weight is $4.05 \times 62.5 = 253.1$ lbs. The weight of the immersed wire then is $1985.3—253.1 = 1732.2$ lbs., and the weight that could be attached to this without breaking it would be $12,144—1732 = 10,412$ lbs.

* * *

Question.—If the allowable working stress in piston rods is 8,000 lbs. per sq. in., what should be the size of the rod for a 24-inch piston with a maximum steam pressure of 120 lbs. per sq. in.?

Answer.—Area of piston $= 24 \times 24 \times .7854 = 452.389$ sq. in. Total possible load is $452.389 \times 120 = 54,286.68$ lbs. Number of sq. ins. required is $\frac{54286.68}{8000} = 6.785$ sq. in. This would be furnished by a shaft $= \sqrt{\frac{6.785}{.7854}} = 2.94$ in dia., or say a 3-inch shaft.

* * *

Question.—The maximum thrust on a piston rod of an engine is 62,000 pounds. If the working strength of steel subjected to shearing under these conditions is 6,000 lb. per sq. in., what size crank pin would be required?

Answer—Shearing strength depends upon the cross sectional area to be sheared off in case of failure. Amount of material necessary is $\frac{62,000}{6,000} = 10.33$ sq. in. The diameter of a pin necessary to give 10,333 sq. inches would be $\sqrt{\frac{10.333}{.7854}} = 3.62$ in., say $3\frac{1}{8}$ inches.

* * *

Question—Skill in design consists largely in making all the parts of a mechanism equally strong. How thick should the head of a 2-inch bolt be in order that the resistance to stripping the head off be equal to the tensile strength of the bolt?

Answer—For a steel bolt consider tensile strength equal to 60,000 lbs. per sq. in. and shearing strength to be 48,000 lbs. per sq. in. The total tensile load a 2-inch bolt would stand $= 2^2 \times .7854 \times 60,000 = 188.496$ lbs. The shearing strength of the head must equal this. The necessary shearing area will be $\frac{188,496}{48,000} = 3.927$ sq. in. One dimension of this area is the circumference of the bolt, which is $2 \times 3.1416 = 6.2832$ in. Necessary thickness of bolt head then is $3.927 \div 6.2832 = .624$ in.

* * *

Question—A piston rod is subjected to a pull of 30,000 lbs. What should be the dimensions of a cross-head key one inch thick?

Answer—This key would be in double shear, therefore the length of the shearing surface would be 2 inches. Using a working stress of 6,000 lbs. per sq. in., a shearing area of $\frac{30,000}{6,000} = 5$ sq. in. would be required. The depth of the required key, then, would be $\frac{5}{2} = 2.5$ inches.

* * *

Question—The cast iron cylinder of a hydraulic press is 10-inch bore and is subjected to a pressure of 5,000 lbs. per sq. in. How thick should the metal be?

Answer—Consider a section of the length 1 inch long. The pressure tending to separate it into two halves is $1 \times 10 \times 5000 = 50,000$ pounds, which is 25,000 lbs. on each side. Working strength of cast iron under these conditions is 3,000 lbs. per sq. in. As a section 1 inch long is subjected to 25,000 lbs., the necessary thickness would be $\frac{25,000}{3,000} = 8.33$ inches.

Green Sand Molds and Their Place in Foundry Practice

By H. R. Shackleton

The subject matter of this article is from a prize essay submitted to the Keighley Association of Engineers. While covering ground familiar to many, it contains much that is of interest and value to those who are novices in the art of iron founding.

As is well known, those molds that are made in various kinds of sands and retain their own moisture till poured or cast, are termed green-sand molds. This method is, without doubt, the one for making the majority of castings in ordinary foundries doing work in connection with modern engineering.

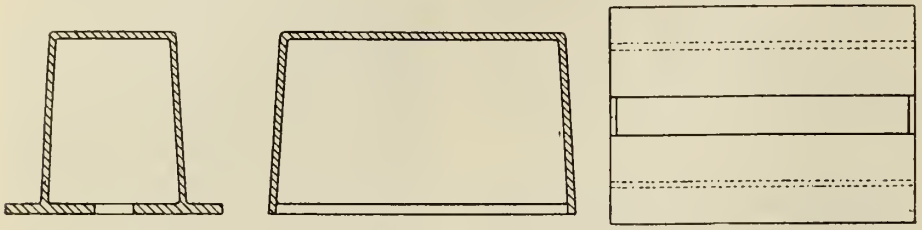

FIG. 1.—SECTIONS AND INVERTED PLAN OF A STEAM CHEST CASTING.

Skin-dried Molds.

Skin-dried molds are those which are rammed up in green-sand, and are then dried skin-deep, after being cleaned up and washed with wet blacking. It will be seen that by skin-drying a mold, the moisture on the surface or face of the mold is reduced to some extent. Skin-dried molds often give sounder and much cleaner castings than do green-sand molds, and when cast do not generate as much steam and gas, and are therefore less liable to give blown or scabbed and dirty castings.

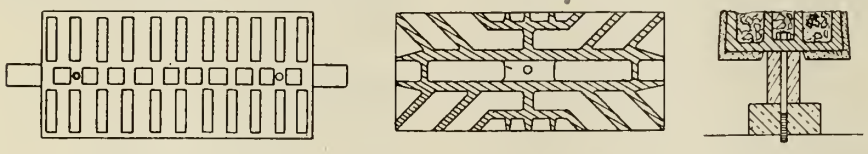

FIG. 2.—INVERTED PLAN, SECTIONAL PLAN AND CROSS SECTION OF CORE IRON.

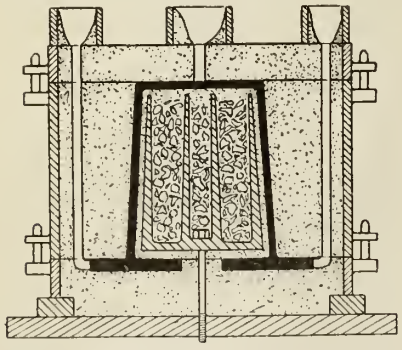

FIG. 3.—SECTION OF ASSEMBLED MOLD FOR CASTING, FIG. 1.

There are molds which it is absolutely necessary to skin-dry, owing to their intricate and delicate construction, such molds being better able to withstand the flow and force of the molten metal in passing down the runner and then over the face of the mold at the time of casting. Reducing the moisture on the face and walls of a mold also stiffens the green-sand cores, and there is not the same likelihood of particles being washed up from the face and the walls of the mold as with green-sand molds.

Dry-sand Molds.

Dry-sand molds are those which are rammed up in the same way as the ordinary green-sand mold, very little regard being given to the amount of moisture the sand contains, so long as the mold will retain its true form and shape. These molds should be vented to a certain extent in precisely the same way as green-sand molds, for although there is no moisture to evict or force through the walls of the mold, there is always a certain amount of gas generated in the sand at the time of casting, which will pass and escape through the vents, without any marked effect.

When not vented, sometimes these molds explode or ignite their gases before the pouring or casting is finished, and the shock causes the face or top of the mold to suffer by small pieces being shaken off, the result being a dirty and unsatisfactory casting, only fit perhaps for the scrap-heap.

Loam Molds

Loam molds are swept up by strickles or striking boards, which revolve around brickwork built roughly to the shape of the intended mold; plastic loam is applied to the brickwork, and is struck on or off, as the case may be, by the striking board or strickle, which revolves on a fixed centre for cylindrical work. The porosity and cohesive properties of loam are obtained by grinding strong sand with water and adding horse manure to give porosity and also claywash and hair for cohesion, or bond. The material is ground to the required state of strength and porosity, and the molds are blackwashed and dried before casting.

Molding in Green Sand.

When molding in green sand, those sands that are charged with moisture above a certain limit should not be used, as any attempt to pour hot metal into a wet mold will immediately generate dangerously large quantities of steam and gas, and the molten metal will not lie on the bottom or face of the mold, gases and steam causing it to be blown or forced back through the runners and risers just after casting. A mold of this kind is no good whatever, but serves to show the danger of an excess of moisture in green sand used for molding. No extra amount of venting will insure a sound casting in such circumstances, and even did the casting appear to be a success, there will be trouble with machining and fitting, and the castings will not stand the strain sometimes required of them, being too hard and brittle.

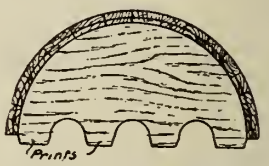

FIG. 7.—SIDE SECTION OF SOLID PATTERN FOR GEAR CASE.

On the other hand, sand rather too dry will not bind, but will fall and crumble away; or if it did stand in the mold, it will very likely be washed away from its position by the force of metal passing from the runner into the mold. It is evident, then, that sound judgment and

FIG. 4.—WEIGHING MACHINE BASE.

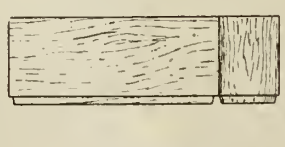

FIG. 5.—SIDE VIEW OF PATTERN.

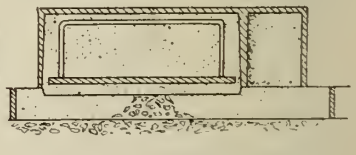

FIG. 6.—METHOD OF MOULDING.

experience combined are required to determine the amount of moisture to be used in the making of clean green-sand molds, which will readily discharge the

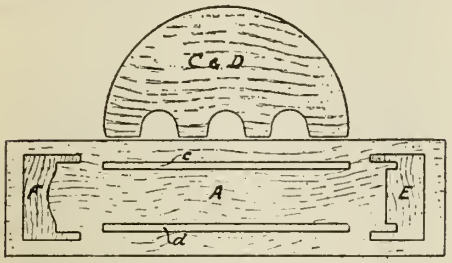

FIG. 8.—CORE BOARD AND FITTINGS FOR MOLDING GEAR CASE.

air and gases, and cause no trouble for the molder or anyone concerned.

Facing sands for green-sand molds call for a large amount of study for various

FIG. 9.—CORE IRON FOR GEAR CASE.

classes of work. Strong or new sands, when ground in the sand mill, increase in bond, and if they are ground too long are entirely unfit for facing sand, so it

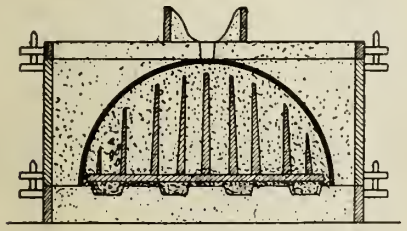

FIG. 10.—SECTION OF COMPLETE MOLD FOR GEAR CASE.

will be seen that a weak sand may be made strong, and a strong sand may be made stronger, up to a certain point, providing there is the necessary amount of moisture present. Sands that contain no clay or bond, or what may be termed sharp or washed sands, are those which must be used to give the required porosity. The sand must retain its shape or form in the mold, so as to give a good face on the casting, and also be so porous that the air and gas may be driven out of the mold without any obstruction, at the time of casting, thereby allowing the metal to lie at rest. Some castings require to have a very fine and smooth surface, these being, as a rule, light and of various descriptions.

Yellow sands are more even in their bond and porosity and are mixed in varying strengths, to suit nearly all classes of foundry work. All foundry sands are affected by atmospheric changes; in other words, an intricate casting may be made to-day with ease and to-morrow

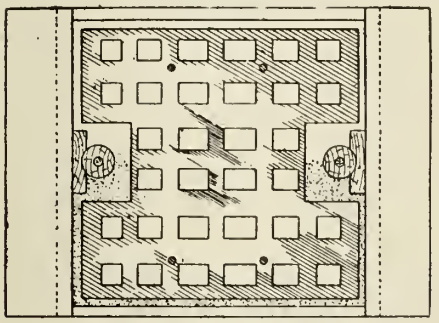

FIG. 17.—CORE PLATE.

may be quite difficult. Also, the finer or closer the sand and the higher the percentage of clay, the greater the risk of the casting being blown or scabbed, and also the greater the time required in venting the mold compared with an open or porous sand.

The accompanying sketches describe the making of some green-sand molds.

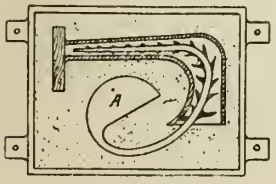

FIG. 11.—MOLDING A SEWING MACHINE ARM

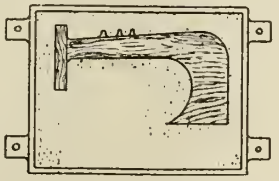

FIG. 12.—PATTERN IN MOLD.

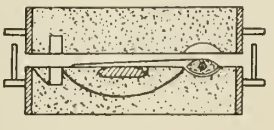

FIG. 13.—SECTION THROUGH MOLD.

Fig. 1 shows sections and inverted plan of a pattern of a type of steam-chest. The core for this casting requires some

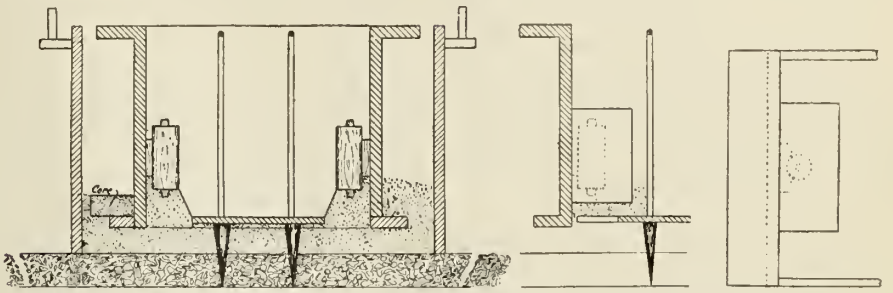

FIG. 14.—MOLDING A MOLDING MACHINE BODY.

FIG. 15.—SHOWING METHOD OF PLACING BOSS. FIG. 16.—PLAN OF CORE PRINT FOR BOSS.

provision to be made for holding it together in the mold, and also to keep it from being lifted or moved while the metal is being poured. Fig. 2 shows the core iron, bottom side, with two lugs which rest on a couple of bricks before being bolted down to the bottom bar shown in Fig. 3. This is simply a flat plate with a screw-hole in the centre, which takes a screw-bolt and holds the core from rising. The core iron is prodded almost to the depth of the inside core, as shown in Fig. 3, and these prods help to stay or hold the inside core together, and also the small coke or breeze which is placed in the middle of the core to assist in making the green-sand core as light as possible.

This mold is entirely built on a coke or cinder bed, so that every facility is given for the core to discharge its gases.

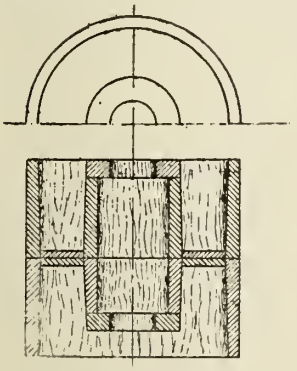

FIG. 18.—PULLEY PATTERN.

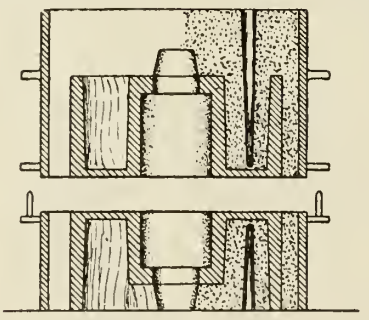

FIG. 19.—METHOD OF MOLDING PULLEY.

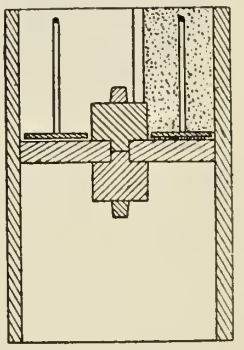

FIG. 20.— MOLDING WEB PULLEY WITH LOOSE WEB.

The secret of making this class of casting is in the use of a clean, open or porous sand. On the first occasion on which the writer saw this casting made the core was not bolted down, but chaplets were placed on the core instead, and when they were bored and plugged the casting showed a certain amount of porosity, and was, therefore, rejected.

In Figs. 4, 5 and 6 is shown a base for a platform weighing-machine, with the inside core made in green sand and lifted direct from the core-box into the core-print in the mold. The round section is made in dry sand, as it is much smaller to dry in the core oven.

In Fig. 7 is shown a side section of a solid pattern of a gear case, which does not require any particulars as regards molding. In Fig. 8 is shown the core-board A, and on this board, at c and d, fit boards C and D. The clamp E holds the two sides straight up. The sweep or strickle is shown at F. The core iron is seen in Fig. 9, while Fig. 10 is a section of the complete mold of the gear case, ready for casting.

It may be mentioned that the base for the platform weighing-machine, and also the gear case, are only molded this way till standard patterns are available, which leave their own cores in green sand when the pattern is withdrawn from the mold.

In Fig. 11 is shown a sewing-machine hollow arm which is molded in an ordinary two-part box. This arm is entirely hollow, and the green-sand core is made at the time the pattern is rammed up, the pattern leaving its own core. This core is entirely carried on the core iron A. As this core has no bearing, except at one end, to keep it from rising and falling, a weight is cast on the core iron, which is bedded or rammed in the drag part of the box, and is thereby kept

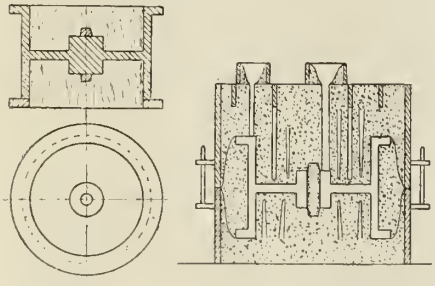

FIG. 21.

stationary till cast. This mold is made with two sand joints, termed a rolling joint.

Figs. 14 to 17 illustrate the molding of a molding-machine body. Owing to the construction of this pattern not being entirely satisfactory, the method shown was adopted. All the inside is lifted out on the core plate as shown. The core plate is lifted out and then the pattern is withdrawn from the mold. Next the portion of sand under the boss pattern at the right-hand side of Fig. 14 has to be cut away before the bottom flanges can be withdrawn, which causes a lot of time to be wasted. The writer would rather withdraw the flanges when ramming up, and cover with a dry-sand core, as shown at the left-hand side, Fig. 14. This method makes a better casting. In Fig. 15 will be seen a half-section of the same casting, the boss being made or put together by two cores made in a core-box.

Fig. 16 is a plan showing core-print of the same method, while in Fig. 15 it will be noted that all the inside is lifted out on the core plate. Fig. 17 shows a plan of the core-plate.

Fig. 18 depicts a half-section of a pulley and shows how the patterns are made in wood, while in Fig. 19 is a sketch of the two halves of the pulley in their respective positions in the cope and drag parts of a molding box, which method is preferable where time is of any consideration. It is also far better to withdraw a pattern from the mold than to withdraw a top part of a mold from a straight and sometimes rough pattern. In Fig. 20 is shown a system of molding a web pulley, where the web is loose, and also the bosses, which are set by a gauge to the depth of pulley required.

Assuming that the pattern is rammed up as shown, the outside rim is withdrawn first, the cope is put on, and the core-iron staples scotched up, bringing the inside core and also half of the boss which is loose. The bosses are withdrawn, the mold is then cleaned up and finished and closed ready for casting.

In Fig. 21 is shown a flanged pulley, and also the finished mold, which is made in an ordinary two-part molding box. This method gives as good results as when made in a three-part box, providing the boss is a little wider and deeper. Sometimes flanged pulleys are made with a pattern having a core-print all the way round the outside pulley face. After the pattern is withdrawn from the mold, a dry-sand core is then inserted in sections, stopping out all but the intended flange. The method shown is preferable.

"DOG DAYS" IN MOTOR FACTORIES.

In common with other motor car factories in Detroit, the Ford Motor Co. are "between seasons," the following notice which has recently been posted up and the suspension of several thousand workmen being ample evidence:

In the regular course of business, we have reached the slack or quiet season, and in line with our policy to be just and fair to the individual employee, we have planned as follows:

Employees will be given a leave of absence without pay, or, if you please, laid off for a period of 30 days. If, during the leave of absence or "laid-off period," the employee can find other employment, the company recommends that he do so.

If, at the end of 30 days, our men have found no other employment and desire to return to work, they may apply and the company will endeavor to find employment for them.

FORD MOTOR CO.

ANNEALING TEXTILE MACHINE CASTINGS.

In a paper read at the recent conference of the British Foundrymen's Association, it was stated that the cast iron used in spindle making was always annealed, and known under the generic name of "black iron." That cast from part hematite, or from iron with about In such a case there was practically no velvety fracture after proper annealing. ten times the quantity of sulphur concombined carbon present, all the carbon being in the form of graphite and annealing carbon. This complete separation of the carbon contributed largely to the iron having a velvety appearance when broken. An iron suited for these castings and combining the best average qualities for rapid production and long life in work would approximate to the following analysis:—Silicon, not exceeding 2 per cent.; phosphorus, not exceeding 1 per cent.; manganese, 0.85 to 1 per cent.; sulphur, 0.08 per cent.; total carbon, as high as possible.

Occasionally it was found that during annealing the castings had acquired an exceedingly hard white skin which no tool could touch, the interior of the casting was quite soft. As the outside of the castings could be readily filed before the anneal, and could not possibly be filed after, it was obvious that the hard skin was acquired during the process. It had been suggested that this hard skin might be due to oxidation, but there could not be oxidation of a casting perfectly covered with coke. In any case the oxide would be red.

The conclusions drawn were:

(1)—Non-continuous annealing ovens produce softer castings than do continuous ovens.

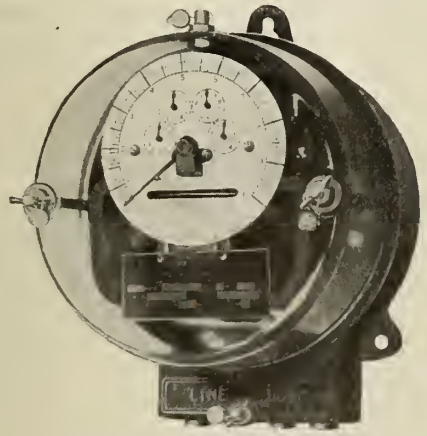
(2)—The hard skin which occasionally appears on the castings is due to the influence of excessive sulphur contained in the packing material. Also the sulphur originally present in the packing material is augmented during each subsequent heating, and this additional sulphur comes from the fuel used in firing.

(3)—Coke dust contains from five to ten times the quantity of sulphur contained in cast-iron borings and thus gets more quickly to the point at which it parts with sulphur to the castings.

(4)—If coke dust be used, an addition of lime retards the effect of the sulphur.

(5)—Coke dust sags during annealing more than cast-iron borings do, and with it warped castings are more common, especially if there has been overheating of the oven.

(6)—The packings should be changed often so that the sulphur may not reach the saturation point where is passes the sulphur into the castings.



PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

WATT-HOUR DEMAND METERS.

FOR many years electric energy was sold altogether at a rate of so many cents per kilowatt-hour used, the rate depending solely on the quantity. Recent years have, however, seen a very decided change in this method of selling, and other factors are now given due consideration, the most important of these being the amount of energy called for or the demand. There has, therefore, arisen a need for a watt-hour meter to measure this value.

Such a demand meter, known as the type RO, has been recently placed on the market, its purpose being to meet the growing need on the part of central stations for an instrument to determine by a simple reading the maximum demand of an installation. This is a single meter which records without the use of

WATTHOUR DEMAND METER.

a clock mechanism both the kilowatt-hours consumed and the maximum kilowatt demand. Fulfilling both these purposes, it is an ideal meter for determining maximum demand and load factor as a basis for rates, as well as the diversity factor of the station. It provides precisely the readings needed on systems that base their charges on maximum demand and power delivered. Both readings can be taken monthly. The meter records the maximum demand of the connected load, but not the time at which the maximum occurs.

The watt-hour demand meter is installed in the same manner as an ordinary watt-hour meter, and requires no additional apparatus or wiring. The maximum demand is indicated by a pointer sweeping over a 4-inch dial, and the watt-hour load is recorded on a 4-dial counter. The instrument has no clock, contacts, or other delicate parts that are likely to require attention, and the mechanism is so simple that maintenance costs are but little more than those of watt-hour meters.

The meter is a combination of an induction watt-hour meter, an induction watt-meter, and an escapement form of time element. It has a standard Westinghouse Electric Co. type OA watt-hour meter movement, including electromagnet, permanent-magnet and aluminum disk, and, in addition, has an auxiliary disk sector supported on a jewel-and-ball bearing, so that it can move in the air-gap of the electromagnet in such a manner that it does not interfere with the accuracy of the main disk, which always rotates at a speed proportional to the load. The rotation of the auxiliary disk is restrained by a spiral spring, making its final deflection proportional to the watts load. The auxiliary disk with its spring and pointer constitute an indicating watt-meter.

The shaft of the auxiliary disk is geared to an escapement wheel, and the claw restricting this wheel is oscillated by an eccentric on the main shaft. The auxiliary disk, therefore, advances step by step at a speed determined by the speed of the main watt-hour meter disk—that is, at a speed proportional to the load. It continues to advance until the spring tension balances the torque produced in the auxiliary disk. The demand mechanism is then in equilibrium and the pointer indicates the watts.

As the total deflection and the rate of deflection of the auxiliary disk vary in direct proportion, the time required to reach the maximum position when any constant load is passed through the instrument is a constant. For example, if a load of 500 watts is supplied to a 5-ampere, 100-volt meter with 15-minute time element, the demand mechanism will reach equilibrium at the 500-watt point in fifteen minutes. If instead, however, a load of 1,000 watts is applied to the meter, the demand mechanism will have to move twice as far to the 1,000-watt point, to reach equilibrium; but the double load will move the watt-hour disk twice as fast, causing the escapement to allow the demand disk to move twice as fast, and it will cover the double arc in the same time. A mathematical analysis of the instrument shows that the deflection for any varying load that does not continue long enough for the instrument to reach equilibrium is equal to the average load during the interval.

The auxiliary disk drives the demand pointer through a dog, and a fine-toothed ratchet and pawl holds the demand pointer in the position of maximum deflection until released by hand. A second ratchet and pawl allows the auxiliary disk to fall back to equilibrium under its spring tension if the load falls below that corresponding to its position at any moment, but prevents it from advancing except as controlled by the escapement as before. The maximum demand pointer can be re-set instantly by pressing a sealed button on top of the cover. This raises the pawl that holds the pointer in its maximum position, and a light spring returns the pointer to zero or to the position of the auxiliary disk.

WATTHOUR DEMAND METER.

The type RO watt-hour demend meter is made by the Westinghouse Electric and Manufacturing Co., East Pittsburgh, Pa.

NEW OSBORN AIR SQUEEZERS.

The line of portable air squeezers designed and built by the Osborn Mfg. Co., Cleveland, Ohio, continues to grow. The two larger sizes have for some time been furnished either as plain power squeezers or as power squeezers with jolt equipment added, and now the line is broadened still further. Both the plain machine and the jolt squeezer can be had with a stripping mechanism, this device being supplied with any of the three sizes.

The air squeezer which is the foundation of this machine series (three sizes) is marked by its notable ease of operation (being automatic in its application of power to the squeeze), the protection of every working part against dirt and dust,

its rugged strength and its simplicity. In the jolt squeezer (two sizes) there is a further advantage, of great value in many classes of work, in that a few jolts before squeezing prevent ram-offs and defective moulds, eliminate tucking, and also speed up production.

A stripping attachment is now regularly supplied, when desired, with either the squeezer or the jolt-squeezer type. Its advantages are obvious, as the stripping device operates automatically and gives a true, accurate draw without the employ-

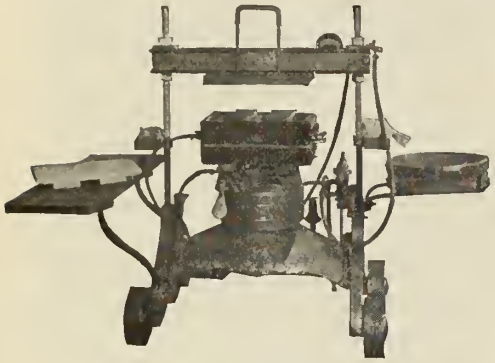


FIG. 1. PORTABLE AIR SQUEEZER, MEDIUM SIZE.

ment of skilled labor. The stripping operation is entirely automatic, but can be worked by hand without making adjustments or changes in the machine. It can be used either with or without tripping be used either with or without stripping able in and out, and also up and down, and are so located that adjustments can be made for any of a wide range of sizes up to the maximum flask-capacity of the squeezer. Any desired depth of draw can be secured.

The stripping operation is as follows: The flask is put on and the mould made

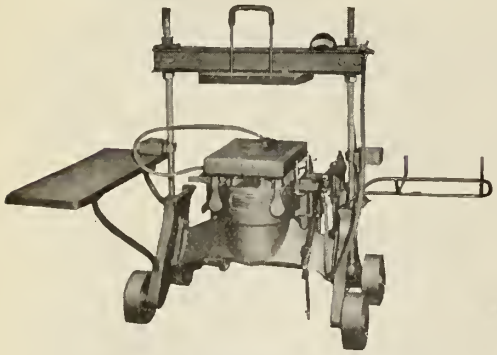

FIG. 3. PORTABLE AIR SQEEZER STRIPPED, MEDIUM SIZE.

as on the regular Osborn air squeezer—that is, the operator simply pushes down the handle of the operating valve, after which compression is applied up to the point at which the release valve has been set. Being released when that pressure is attained, the machine automatically returns to off position. The jolt, if used, is operated by a separate knee-valve. The stripping device is partly attached to the squeezing head and, as the head descends to make the squeeze, the stripping mechanism is raised to working position. After the mould has been squeezed and as the head is descending, the flask comes

FIG. 5. PORTABLE AIR SQUEEZER, NO. 74-W.

in contact with the stripping-pins and the pattern is automatically drawn.

It should be especially mentioned that the speed at which the flask is stripped

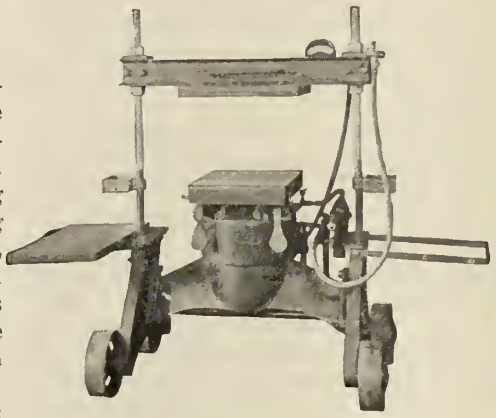

FIG. 2. PORTABLE AIR SQUEEZER JOLT, MEDIUM SIZE.

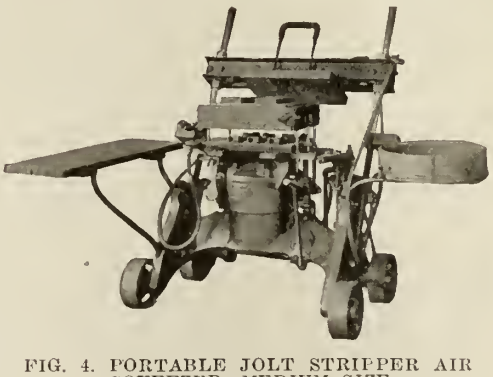
from the pattern is just one-half the speed at which the head is lowered; this makes for surety and accuracy. Another



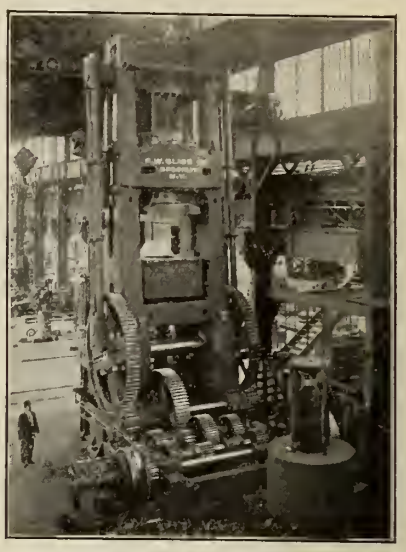


FIG. 4. PORTABLE JOLT STRIPPER AIR SQUEEZER, MEDIUM SIZE.

important point is that the speed at which the mould is stripped from the pattern can be anything from very rapid to very slow and easy—whatever conditions may demand.

LARGE BLISS DRAWING PRESS.

The press illustrated in the various photographs shown was recently designed and built by the E. W. Bliss Co., of Brooklyn, N.Y., and is among the larg-

REAR VIEW, SHOWING GEARS.

est drawing presses ever built. It is of tie-rod construction in which all the working strain is taken by large vertical steel tie-rods, has an extreme height of about forty feet, and weighs close to 650,000 pounds. A fair idea of its immense size may be obtained by the comparative size of the men seen in the illustrations.

The press was designed to draw steel shells as large as 48 in. in diameter. It will draw and lift out shells as deep as 40 in. and draw and push through shells 45 in. deep. When shells are lifted out, the positive bottom knockout which is stationary, but adjustable for the different

DIE TABLE AND TWO CONNECTING LINKS.

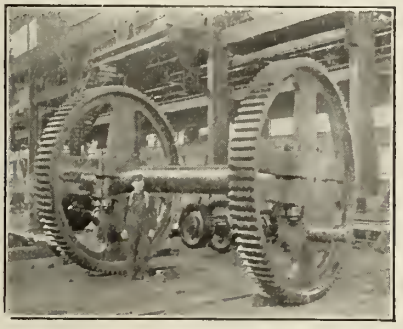
heights of shells, is used. Blanks as large as 64 in. in diameter and 3-16 in. thick may be drawn.

The table carrying the die is operated by a powerful toggle motion which connects to the two crank pins on the main gears. The plunger carrying the punch is operated by the steel cross-head, which is coupled by two double connecting rods to the crank pins on the main gears. The blank-holder is stationary. The plunger and blankholder adjustments are each accomplished by independent electric motors, there being a separate motor for each adjustment. Before adjusting, the blankholder is unlocked, and after adjusting is locked by an electric motor. All motors for adjusting are directly attached to the machine.

The entire train of gearing is of steel with machine-cut teeth. There are three ratios of gearing: 200:1, 100:1, and 67:1. By means of change gears, the speed of operation may be varied from 1½ to 3 and 4½ revolutions per minute as may be required for the different classes of work to be produced. The cross-head and bed are counterbalanced by a hydraulic accumulator which may be placed above or below the floor line nearby or as may be most convenient. The drive is by a 200-h.p. electric motor, while the control is by means of a powerful hand-actuated friction clutch of the double-grip type.

HUGE ORDER RECEIVED FROM CHINESE GOVERNMENT.

The Niles-Bement-Pond Co., of New York, has been awarded a contract amounting to over $1,000,000, by the Chinese Government for the complete equipment of a small arms arsenal at Hanyang (near Hankow), China. The machines will be built at their Pratt & Whitney Works, Hartford, Connecticut, in a special department exclusively devoted to the manufacture of this particular type of equipment.



The Niles Company was in competition with the large gun machinery manufacturers the world over. As in the case of the new Australian Government rifle factory which was completely equipped by the Pratt & Whitney Works, the delivery limit together with the efficiency of the proposed equipment and the production time guarantee were again the deciding factors. The contract calls for machinery to produce 100 complete army rifles per day and a considerable amount of other military equipment. It will include metal, wood, and leather working machinery, fixtures, gauges, etc. All parts must be so accurately made that they will be absolutely interchangeable, thus insuring the perfect working of each gun in time of action.

As already stated an important factor in the securing of this contract was the guarantee of production. Under present conditions in China, 90 hours actual time is required for producing each complete rifle while, with the new equipment, the time guaranteed is less than 23 hours.

The plans for the Chinese arsenal are such that no one man will perform more than one or two simple operations and therefore will soon become proficient on just that class of work. Experienced engineers and gun makers from the Pratt & Whitney Works will instruct the Chinese workmen after the equipment is installed.

While the terms of payments have necessarily been made to suit the present financial situation of the Chinese Government, the Company feels confident—as a result of their representative's report—that the stability of the existing Government is assured and that they will soon be in possession of adequate revenues, as a result of the reforms and economies which are now being effected.

The government arsenals equipped by the Pratt & Whitney Works in England,

MAIN GEARS.

Germany, France, Australia, Belgium, etc., etc., as well as the United States Government arsenals at Springfield and Rock Island, speak well for the years of patient study which this concern has devoted to the important work; the one thought ever uppermost being "How can we improve our designs in order to produce a better gun in a shorter time."

Various other works of the Niles-Bement-Pond Co., make a specialty of machinery for the manufacture of heavy ordnance and armor plate. A gun lathe for machining ordnance up to 16 inches bore has recently been shipped by them to Austria; ten freight cars being required to carry this one machine from their Philadelphia works to the seaport. Several of these large gun lathes have been built by them for the Italian Government arsenals and a number of very large lathes, boring and turning mills and planers have recently been shipped to England, France and Germany.

In view of present business conditions, the Niles-Bement-Pond Company, is to be congratulated on the receipt of recent orders from abroad for a large number of railway wheel and axle machines, as well as machine shop equipment. The Niles' 36-foot boring and turning mill ordered for the United States Navy Yard, Brooklyn, is being set up. Thirteen large freight cars were required to carry the various parts of this machine.

In a recent shipment to France was included the largest boring and turning mill ever exported from the United States.

Pigeon, Pigeon & Davis, Patent Attorneys, Montreal, report that 122 Canadian Patents were issued in Canada on May 26th, 1914, 83 of which were granted to Americans, 28 to Canadians, 7 to residents of foreign countries and 4 to residents of Great Britain and Colonies. The following is a full list of those patents issued to Canadians:—

C. Wokes, Toronto, Ont.: "Brick Making Machines."

C. G. Ashley, Toronto, Ont.: "Perforated Tape Reproducers."

A. W. Laberre, Bulwer, Que.: "Lightning Rods."

G. T. Reiss, Hamilton, Ont.: "Wheelpress Tail-blocks."

J. Carmichael and R. Whipps, North Vancouver, B.C.: "Devices for pulling on shoes."

G. Francis Armstrong, Hamilton, Ont.: "Heaters for Incubators."

H. N. Bingham, Indian Head, Sask.: "Automobile wheels."

F. A. Breeze, Newburgh, Ont.: "Clamping screws and operating mechanism."

LACK OF BUSINESS MEN IN PUBLIC LIFE.

THAT Canadian business men shun public life, or to be more specific, the political and municipal feature of it, is, to say the least, regrettable, because they thereby encourage a condition of things in these particular spheres that can only be expressed as deplorable. As was aptly stated by the retiring president of the Canadian Manufacturers' Association at their recent convention in Montreal, there are too many lawyers and farmers in our legislatures, and while in many respects these may be very estimable gentlemen, it is a notorious fact that they are heartily out of sympathy with what is after all the back-bone and sinew of our nationality, the manufacturing and industrial community.

A sample of sublime ignorance in this respect was the effort of the Postmaster-General to burden particularly the publishers of technical journals by increased postage on their product. The above genius failed to appreciate, he most likely never knew, until his attention was drawn to it, that the cream of our youth and the pick of our manhood depend meantime as hitherto for being kept posted on and educated in the intricacies of their varied trades, on these very periodicals he sought to raise in productive cost and therefore purchase price.

THE BUSINESS SITUATION.

THE one outstanding conclusion from the many that have been drawn relative to the unfortunate industrial situation in which this Dominion finds herself to-day is that during the past five years we have been hitting a too rapid pace.

With a monotonous regularity and intonation, bank, association and company annual meetings have been told that we were going ahead much too fast for our resources, and that the present condition of affairs is none other than the reckoning time for our indiscretions. One of the most interesting features in all of this out-pouring is that expressed by the little but all-embracing pronoun, **we**. It reminds us of a number of apprenticeship experiences in which, when some achievement was accomplished, the foreman declared himself alone personally worthy of the honor, but if error, followed by trouble, happened to be the outcome, then **we** brought it about, and not he; oh no.

To our mind there is too much generalisation as to the cause and responsibility for the existing depression in our midst, and too little tendency to apportion or even appropriate the blame. It is neither a question of democracy nor aristocracy, but it is an attitude of our financial and business magnates which has been proven to be altogether wrong. In certain departments and spheres of activity the most highly developed and concentrated efforts are being made to secure efficiency, but who shall say that our national purse strings have been adjusted to maintain the proper balance between our resources development and the capital outlay.

Our citizens for the most part are blissfully unconcerned as to the "why and wherefore" of this depression period, their principal questionings being relative to its passing, and most of them, particularly those who have passed through similar periods, have come to look on each recurring occasion with more or less resignation. However any of us may view the present business situation, complacently or ready to blame, there is little likelihood of anything miraculous being seen in the display of caution when the next boom begins; rather is there to be feared a repetition, on an even more advanced scale, of reckless optimism. History generally repeats itself.

The end of much unnecessary parleying at Ottawa, with its for the most part politically suspicious insincerity, and the decision to guarantee the bonds of the C.N.R. to the extent of $45,000,000 brings already indication of an impetus to our low ebb industrial situation. An order has just been placed with our big steel corporation for 45,000 tons of steel rails by the above road, and in addition to this we are informed that further tonnage is in sight.

Why the long drawn-out discussion on this guarantee question? It is beyond the wit of man to conceive, as aside altogether from the two men most intimately involved, and round whom the battle, if we might call it so, was really fought, neither government nor opposition had the slightest excuse, except it were incapacity to appreciate the industrial situation, to play fast and loose as they did.

INDUSTRIAL NOTABILITIES--No. 39

CHARLES NEWTON CANDEE, vice-president and managing director, Gutta-Percha & Rubber Co., Ltd., Toronto; secretary and director the Toronto Rubber Co., Ltd.; secretary and director the Winnipeg Rubber Co., Ltd., and secretary and director Vancouver Rubber Co., Ltd., was born at Rochester, N.Y., March 2, 1860, the son of James Goodrich Candee, merchant, Syracuse, N.Y., and Mary F. (Ackerman) Candee. He came to Canada and settled in Toronto, Oct. 28, 1886, and was naturalized as a British subject.

Mr. Candee commenced his business career as clerk in the wholesale and retail rubber establishment of O. W. Clary, Syracuse, N.Y., 1879; remained there in various capacities until October, 1886, when he received the appointment of assistant manager Gutta-Percha & Rubber Mfg. Co., Toronto. He was appointed secretary of the company Jan. 26, 1889, and when the business was reorganized Jan 1, 1913, he became vice-president and managing director.

CHARLES NEWTON CANDEE.

His entire business career has been devoted to the rubber industry with which the family name has been identified since its earliest stages; the first license to manufacture rubber goods under his patents being issued by Charles Goodyear to Leverette Candee.

He is a member Toronto Board of Trade, and governor Toronto Conservatory of Music, and married Anna Park Taylor, daughter of Washington S. Taylor, Memphis, Tenn., April 20, 1892, by whom he has one son and three daughters.

His clubs are the York, National, Royal Canadian Yacht, Lambton Golf and Country, Rosedale Golf and Canadian.

He is warden, St. Paul's Anglican Church, Toronto, and his residence is at 39 South Drive, Toronto, Ont.—Photo, Courtesy International Press.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., June 15, 1914.—There has been very little change in the business outlook, and reports generally are that trade is still quiet and little is being done in the way of construction. While there is a disposition on the part of most people to look hopefully to the future, it has to be admitted that at the present time there is a marked dullness.

Locally, there is considerable construction going on, notably the Sun Life Building, the National Trust Building, the new Imperial Bank, while several theatres are projected in the uptown district. One of the latter, which will be built by the Keith interests, will have a seating capacity of over 4,000. In the residential districts there is also quite a lot of construction work under way, and it is notable that a number of new apartment houses are being erected of reinforced concrete. This has resulted in large sales of concrete mixers to contractors. So far as machinery is concerned, the principal business of late has been in contractors' supplies and municipal equipment, such as road-making machinery, etc.

A representative of one of the big machinery supply houses, who was in Ontario last week, said he was greatly impressed with the work being carried on at the new Welland Canal. It is understood, however, that contractors' supplies have been pretty well bought up for this work.

Metals.

The metal markets continue to show a general weakness, the only exception being lead, which has shown some strength lately, especially in London, due largely, it is stated, to the Mexican situation. The market for pig iron is at a low ebb, and, according to some authorities, has about reached the bottom. Buying has been light, and it is understood that many of the big companies have instructed their purchasing agents to buy only for immediate needs at present, evidently being satisfied that there is little reason to anticipate higher prices for a while. During the last week some big American contracts were closed up, but this is not classed as new business, as in every case the orders had been hanging fire for several months, and were only closed now that the market was considered more favorable.

There is a feeling that an improvement will be experienced in business in the very near future. It is felt that in view of the Canadian Northern getting their aid from the Government, and the Grand Trunk getting their bonds guaranteed, that there will soon be some business developed. It is known that both roads are contemplating the building of new cars, and when this work comes through it will be a means of brightening up the situation. The C.P.R. is not doing a great deal of car building at the present time; a large number of their hands being still laid off and the shops working at reduced pressure.

Toronto, Ont., June 16, 1914.—No change is to be observed in trade conditions this week. As an improvement was hardly to be expected, there will be no disappointment. The general opinion seems to be that quiet times will be the rule until the fall, when, providing the crops are good, some improvement will be felt. If, at the same time, the foreign outlook brightens, there should be an upward movement in export as well as internal trade.

Charles B. Gordon, in his presidential address delivered before the Canadian Manufacturers' Association in Montreal recently, gave some good advice on the necessity of more economical methods of production and development. If this advice is taken to heart and practised in good as well as in bad times, the country generally will derive much benefit, and development will proceed on a sounder footing.

Expenditures are now being made on a more conservative basis and the depression will no doubt show the necessity of exercising economy in methods of raising capital as well as in the spending of it. The temporary check in progress should eventually prove of the greatest benefit to the Dominion.

Steel Market.

Conditions in the steel and iron market have not improved, business still being very quiet. There are, however, indications that there will be some revival within the next two or three months. The building permits for May show a decrease over the corresponding month last year. The building trade is quiet and there is little demand for structural steel.

The bills for granting assistance to the C. N. R. and the G. T. P. have passed the Senate, and a large amount of money will be released for expenditure on these roads. It is reported that the C. N. R. have already placed a large contract for rails with the Dominion Steel Corporation, amounting to nearly one and a half million dollars. Orders for equipment such as locomotives and cars will no doubt follow. It is highly probable that the G.T.P. will come into the market soon for material, but not to as great an extent. The expenditure of so much money will have a beneficial effect on business generally.

Reports from Pittsburgh and Chicago state that business is improving and that several substantial orders have been placed recently. There appears to be a feeling that the worst of the depression in the steel trade has been reached and that prices have reached their lowest.

Pig Iron.

The pig iron market is quiet with no change in prices. Buying is of a hand-to-mouth order, consumers not being

anxious to carry heavy stock with trade in its present condition.

Machine Tools.

The machine tool business is also quiet, a few small orders only being placed. Comparatively few new machine shops are being put into operation and the majority of the existing plants have enough tools to keep them going.

It is probable, however, that the C. N. R. will soon be in the market for machine tools, as specifications were prepared early in the year but never issued. A local dealer reports having sold 14 tumbling-barrels to the Massey-Harris Co. for their Brantford, Ont., plant. The mills will be made by the R. McDougall Co., of Galt. The Toronto Street Railway have purchased a "Ryerson" special combined punch and shear, fitted with a coping attachment.

Metals.

The general condition of the metal market shows quite a little improvement. More business is being done, but in small lots. There is no change in prices this week.

Ottawa, Ont., June 15, 1914.—A valuable inquiry into the possibilities of South African trade has been made by W. J. Egan, Canadian Trade Commissioner for South Africa. He makes an extensive report on the machinery and hardware trade of South Africa, which is at the present time almost entirely in the hands of Great Britain, Germany and the United States. The greatest increase in Canadian trade is possibly in automobiles. While the total trade has doubled since 1912, Canada has increased her trade more than threefold. In 1913 Canada exported to South Africa motor cars to the value of £157,178. Mr. Egan, in giving advice to exporters, says:—

"Correspondence from all Canadian firms seeking an export market should include complete information in the first letter in reference to the following particulars: Catalogue or list with same; the f.o.b. prices Montreal or St. John; how the goods are packed and in what quantities; size of case or parcel, and weight; season of delivery; if no arrangement with other Canadian manufacturers for representation is made or direct representatives sent, what commission will be paid; what will be allowed per year for guarantee on missionary work; how lines are sampled; if machinery, will aluminum or other models be sent; is the line advertised, and if so how much is allowed per annum; what means of advertising is recommended, also an arranged cable code if necessary. With information of this kind and any other that may suggest itself it is possible to place the proposition before interested parties in such a way that business must result much more quickly than under present conditions where little or no information is offered."

Trade figures just prepared by the Trade and Commerce Department giving details of the commerce of Canada for the twelve months ending March 31, show that there was a decrease in iron and steel imports of some $19,000,000. The imports in iron and steel and manufactures thereof, were $138,648,364 for the 1913 period, as against $119,221,241 for 1914. Brass and manufactures of brass imports were $5,288,082 in 1913, as compared with $4,415,202 in 1914. Copper and manufactures of copper imports in 1913 were $7,548,530, and in 1914 they were $6,581,485. Tin and manufactures of tin imported were $7,242,494 in 1913, as compared with $6,581,485 this year. As for exports of metals and minerals and manufactures thereof, there was a decrease from $27,225,694 in 1913 to $25,041,352 in 1914.

Winnipeg, June 15, 1914.—L. C. Williams, Biggar, Sask., has written our western office asking where he can purchase brickmaking machinery, and a stationary engine of from 25 to 50 horsepower. He stated that he will require these in a hurry. The brick-making business seems to be thriving in the West, as several machinery brokers are figuring on new plants.

The Medicine Hat Radiator Co., have been contemplating the erection of a plant in Medicine Hat, Alta., for two years or more, but have now reached the stage at which they will probably buy the necessary equipment. Several Winnipeg houses are figuring on same. Carey Wright is one of the heads of the new enterprise.

Machine tools are probably in less demand just now than they have been for many years. The demand for grain elevator equipment has, however, been unusually good of late. Steam goods are very quiet.

The Stuart Machinery Co., this week sold the Stuart-Arbuthnot Lumber Co., Winnipeg, a 40 h.p. motor to drive their new plant. The Manitoba Rolling Mills, Selkirk, are buying an engine and generator as well as several motors. This will about complete their equipment.

St. John, N.B., June 13, 1914. — The contract for the construction of the foundation of the new buildings and wharf at West St. John, has been awarded to the Maritime Dredging & Construction Co. The Minister of Public Works has also authorized a call for tenders for the superstructure of the new shed to be erected. Steel will be used in the buildings which will be about 135 feet wide and 800 feet long. M. W. Doherty, general manager for the Maritime Dredging & Construction Co., said last night that there were now two reclamation plants at work with 470 men.

George McArthur, contractor, of St. John, has been given the contract for the erection of a new armory at Sussex, N. B. His tender was between forty thousand and fifty thousand dollars. The new drill hall and armories will be of two storeys. It will be 136 feet in length by 66½ feet in width. Ground will be broken in a few days.

The corner stone was laid this week for the new post office to be erected at Milltown, N.B. The building will be a large brick edifice of two storeys. Joseph McVay of St. Stephen, N.B., is the contractor.

The big steam shovel to be used in the excavations for the new pulp mill of the Bathurst Lumber Co., at Bathurst, N. B., is now on the ground and work will be started in a few days. Workmen are now engaged drilling at the site of the mill, preparatory to a start on the foundations.

CANADIAN MANUFACTURERS' ASSOCIATION CONVENTION.

The annual convention of the Canadian Manufacturers' Association, held in Montreal last week, showed, in spite of the general business depression throughout the Dominion, that progress and prosperity had been the lot of the Association during the year just closed. Naturally trade conditions occupied a prominent place in the remarks of different representatives, and numerous observations were made as to not only a prevention of such important occurrences, but relative also to the immediate outlook for a revival.

A distinct warning was given the delegates that if they were unreasonable in their tariff demands it might lead to either a disunited Canada, or else to a tariff revolution such as had recently been experienced in the United States. This warning was given by Mr. Charles A. Dunning, manager of the Saskatchewan Co-operative Elevator Company, who came as a representative of the Saskatchewan farmers to present their ideas to the eastern manufacturers. Mr. Dunning's address was greeted with prolonged applause, while the chairman congratulated him on the moderate and reasoned manner in which he had presented the views of the western farmers.

As mentioned elsewhere in this issue, the question of a larger percentage representation of manufacturers in our legislatures came up for discussion, and while all were generally agreed on the necessity for same, little encouragement was evident from those on whom the choice would fall.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Edson, Alta.—It is proposed to install an electric light and power system at a cost of $40,000.

Wolseley, Sask.—It is proposed to make extensions to the electric lighting system at a cost of $4,000.

Winnipeg, Man.—The Oribo Manufacturing Co. will erect a factory for making metal products. The cost will probably be $9,500.

Rock Island, Que.—The Union Twist Drill Co. will build a machine shop here. C. L. Chamberlain, of Worcester, Mass., is the architect.

Quebec, Que.—The Ross Rifle factory will be moved to St. Sauveur near here where 153 acres have been purchased at a cost of $20,000.

Benito, Man. — The Benito Machine Works have added very extensively to their plant, and are now in a position to handle every branch of machine repair.

Medicine Hat, Alta.—Preparations are being made for continuing the construction of a plant for the Dominion Sanitary Foundry Co., which was commenced last year.

Cobalt, Ont.—The York, Ontario, Silver Mines, Ltd., have increased the capital of the company to $1,500,000. Extensive developments are proposed and an electrically-driven air compressor may be installed.

Estevan, Sask.—Tenders will be received up till July 1, for the supply and erection of generators, exciters, gas engines, and a switchboard. Plans and specfications may be obtained from S. G. Lethbridge, Town Electrical Engineer.

Lethbridge, Alta.—The Petrie Mfg. Co., of Guelph, Ont., have selected Lethbridge as a distributing point for their cream separators and farm machinery. The company will build a warehouse here.

New Glasgow, N.S.—The Acadia Coal Co., of Stellarton, N.S., are making considerable extensions to the plant at the Allan Shaft. Some equipment, including an air compressor, has already been purchased.

Saskatoon, Sask.—The tenders for new boilers which were called some time ago will now come up for consideration by the Council, as the by-law authorizing the purchase was recently carried, at the second vote.

Toronto, Ont.—The Polson Iron Works on the Esplanade at the foot of Sherbourne street was visited by two disastrous fires Sunday morning, entailing a loss of about $20,000. The first fire which completely gutted the blacksmith shop, broke out early in the morning, and was the cause of the second blaze, which partially destroyed the machine shop. The loss in both cases is covered by insurance. The progress of the work at the plant will not be interfered with.

TENDERS FOR MACHINE TOOLS.

The Victoria Government Railways, Australia, are calling tenders as follows:—

Grinding machines and accessories.

Heading and forging machines and accessories.

Double head screw machine and accessories.

Steam hammer.
Radial drill.
Splitting shear.
Axle journal turning lathe.
Automatic stud machine.
Hexagon turret lathe.

Iron frame, sash, door and blind clamping machine.

Paint grinding mill.

Horizontal hollow chisel mortiser.

Shaping machine, single head.
Improved general joiner.
High-speed radial drill.
Single end punch and shear.

Double head bolt screwing machine.

Gap lathe, high speed.
Single spindle sensitive drill.

Tenders will be received in Melbourne up to September 2, 1914, and should be forwarded by mail-boat leaving Vancouver on August 5, 1914. Manufacturers not having agents in Australia, can submit tenders through the Imperial Export Co., who have branches in Toronto, Ont., and Melbourne, Australia. Further particulars can be obtained from the Department of Trade and Commerce, Ottawa, Ont.

Municipal

Brock, Sask.—The Council may buy road machinery.

Welland, Ont.—It has been decided to install a fire alarm system.

Fort Erie, Ont.—It is proposed to install a sewage disposal system here.

Sydney, N.S.—The Council have decided to appropriate $16,000 for a fire hall.

St. Mary's, Ont.—The Perth County Council have voted $20,000 for road improvements and $6,000 on bridges.

Nanaimo, B.C.—The town will probably spend $30,000 on waterworks extensions.

Winnipeg, Man.—A by-law will probably be voted on to authorize the Winnipeg Omnibus Co., to operate a service of motor buses.

Alberni, B.C.—Two by-laws have been carried, to raise $15,000 for an electric lighting system and $12,500 for waterworks extensions.

Battleford, Sask.—The construction of waterworks is proposed by the town council. Permission has been granted by the Provincial Government to raise the sum of $30,000.

Minnedosa, Man. — The ratepayers carried a by-law on June 5, to guarantee the bonds of the Minnedosa Power Co., to the extent of $50,000.

Victoria, B.C.—Over sixty applications for the position of industrial and publicity commissioner for the recently organized Victoria and Island Development Association have been received.

Port Alberni, B.C.—The following by-laws will be voted on by the ratepayers on June 18: Street improvements, $10,000; bridge building, $6,000; municipal buildings, $7,500; electric light extensions, $10,000.

Chatham, Ont.—The city will probably buy a motor fire truck. The necessity of buying such equipment was urged at a council meeting, held recently, by Fire Chief Pritchard.

Victoria, B.C.—It is proposed to build a town hall and fire station at Esquimalt. The cost is estimated at $30,000, which includes $15,000 for the town hall, $5,000 for fire station, and $8,000 for firefighting apparatus. A by-law will be voted on shortly.

Orillia, Ont.—A by-law will be voted on June 18, to install a new filtration plant. The by-law was discussed at a public meeting Saturday, and Dr. McCullough spoke on different filtration plants and results. The maximum cost is estimated at $25,000.

Port Arthur, Ont.—Secretary Goodier of the Board of Trade sent five hundred new publicity folders to be distributed on board the steamer Noronic when she left Sarnia on June 13 for Port Arthur.

Saskatoon, Sask.—Heenan & Froude, Ltd., who were recently awarded a contract for an incinerator at $70,000, have submitted a revised tender at $100,000. It is probable that the new tender will be accepted but nothing will be done until the expenditure of the extra $30,000 has been authorized by the ratepayers.

Transcona, Man.—On June 6 the electors carried three important money by-laws, authorizing the expenditure of the sum of $425,000. The by-laws called for the expenditure of $115,000 for water works system and fire protection, $100,000 for sewerage system, and $25,000 for incinerator. The $100,000 to cover sewerage does not include the distribution system, which will be assessed as local improvements.

Lethbridge, Alta.—The following by-laws will be voted on by the ratepayers on July 3. Powerhouse extensions, $3,611; electric light and power line extensions, $12,834; street railway extensions, $3,691; elevator in industrial building, $2,300; water meters, $37,484; completion of high pressure water system, $31,865; new intake to waterworks system, $19,550; new water services, $3,450; water mains, $3,450.

Montreal, Que.—The annual meeting of the Montreal Water & Power Co., was held on June 10, when the report of the operations of the company for the past year was presented by the president Edwin Hanson. The old board was re-elected as follows: Edwin Hanson, president; T. J. Drummond, vice-president; and William Hanson, A. F. Riddell, John MacFarlane and T. Bienvenue.

Saskatoon, Sask.—On June 5, the following by-laws were carried: Site for new power house, $15,000; electrical extensions, $200,000; exhibition buildings, $10,000, and police patrol system, $10,000. These by-laws were turned down by the citizens on May 1, but it was decided to have another vote as it was thought that the necessity of having these improvements was not properly understood by the ratepayers.

Regina, Sask.—As a result of a couple of propositions brought before the finance committee by Industrial Commissioner McInnis, the finance committee decided to recommend to the city council the advisability of taking a plebiscite of the ratepayers as to the policy which shall be followed by the council in offering inducements to industries. It will also be recommended that a by-law be submitted asking permission to raise money on debentures to provide funds for the erection of warehouses, which would then be sold on terms to good concerns who might wish to locate in Regina. It is proposed to take this step on account of an anti-bonusing law which was put in force last February.

Sarnia, Ont.—The industrial committee reports that they are in communication with two industries located in the United States, and had received a visit from representatives of one of these. The industry already has a good trade in Canada and is rated for half a million in their home plant. They seek a vacant building in which they can commence building a line of machinery, but were unable to find a suitable building vacant in Sarnia. An effort is being made locally to have a building erected on a rental basis and another visit will be made shortly by one of their officials. The other industry seeks to purchase fifteen acres of land on a railway siding, and has asked replies to a list of questions regarding Sarnia as a manufacturing point.

General Industrial

Toronto, Ont.—The Gutta Percha and Rubber Co. will make an addition to their factory.

Sherbrooke, Que.—The Canada Cement Products Co., will probably locate here. Mr. Parker is interested in the company.

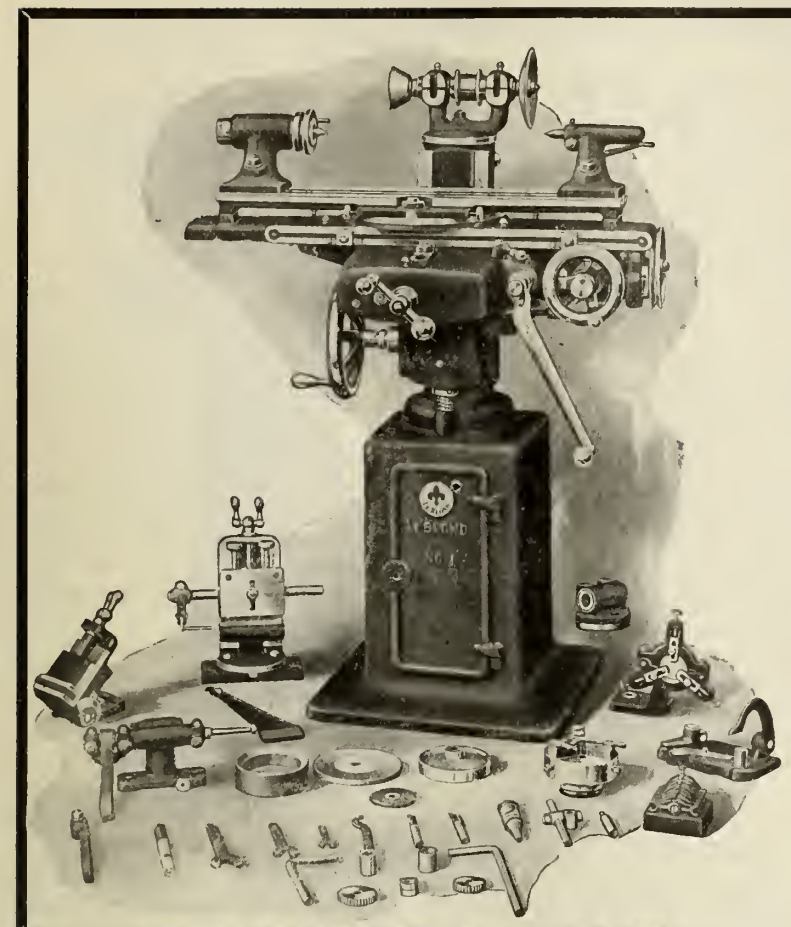
Orillia, Ont.—Fire destroyed McAlarys Bros.' boat factory on June 10. The loss is estimated at $2,000, partially covered by insurance.

Oakville, Ont.—The by-law granting the Glassco Jam and Preserve Mfg. Co., exemption from taxation and free water for a period of ten years will be voted on June 22, and will undoubtedly carry.

Waterloo, Ont.—The ratepayers will vote on the industrial by-law providing for a loan of $15,000 and other minor concessions to the Doering Trunk Co., Ltd., on Friday, July 3. The proposition has been approved of by the Board of Trade and Town Council, and little opposition has been voiced against it among the citizens generally.

Windsor, Ont.—The by-laws voted on to grant exemptions to the Canadian Zagelmeyer Co., and Maul & Riggs Co., were carried on June 5. The Maul & Riggs Co. have already started up an artificial stone plant on the No. 1, factory district.

Medicine Hat, Alta.— Not less than $100,000 is to be spent by the Lake of Woods Milling Co., for extension and improvements on their newly-acquired plant here. It is expected to double the present capacity of the mill, greatly increase the warehouse facilities and enlarge the elevator capacity to three times the present size.



Victoria, B.C.—Within two weeks the city will make a start on the trenching work for the steel pressure pipe line to be laid from the city to Humpback Reservoir for the Sooke Lake water works system. A camp is now being formed, and it is expected that, when work is underway, from 100 to 125 men will be employed. The contractors for the steel pipe fabrication, the Burrard Engineering Co., are rapidly getting ready the plant at Thetis Cove, Esquimalt Harbor. Some additional plant has been brought over from Vancouver, and the delivery of the fabricated sections will shortly commence.

Montreal, Que.—The directors of the Premier Glass Co., of Canada, Ltd., the new concern whose offering of $900,000 preference stock in London the other day came somewhat as a surprise here, are Sir Douglas C. Cameron, Winnipeg; R. B. Bennett, M.P., Calgary; A. W. Fraser, Ottawa; G. T. Somers, Toronto; G. A. Simard, Montreal; with two English representatives, Sir James Pender and John R. Payne. The company is to have plants at Montreal, Selkirk, Man., and Regina. As construction of the eastern factory here is stated in the London prospectus to be 85 per cent. accomplished, and the situation of the plant is given at St. Pierre aux Liens, apparently it is through this new company that the Atlas Glass Works is to be re-organized. Bondholders of the later company meet on July 3 to pass on a reorganization plan.

Tenders

St. Lambert, Que.—Tenders will be received up to June 22, 1914, for the supplying of a hot bituminous concrete mixer. Specification may be obtained from E. Drinkwater, town engineer.

Toronto, Ont.—Tenders will be received up to June 23, for the supply of two tandem steam road rollers. Specifications may be obtained from purchasing department, City Hall.

If it's Machinery Write "Williams"

The A. R. Williams Machinery Company, Ltd.,

64-66 Front Street West, Toronto

Calgary, Alta.—Tenders will be received up to Wednesday, June 24th, 1914, for the supply of the following water meters:—100 1-in. meters, 50 ¾-in. meters, 20 2-in. meters. For further information and copy of specification apply at the office of the Waterworks Engineer, City Hall. J. M. Miller, city clerk.

Ottawa, Ont.—Tenders will be received until July 27, for the quay wall and excavation at Victoria Harbor, B.C. Plans, etc., may be obtained from the offices of the district engineer, Victoria, or at the Confederation Life Building, Toronto. R. C. Desrochers, secretary, Department of Public Works, Ottawa.

Outremont, Que.—Tenders will be received until June 23 for (a) 20,000 feet of rubber covered single conductor cable; (b) 1,500 nitrogen filled tungsten lamps; (c) six series tungsten regulators, transformers and switchboards. Specifications and form of tender are open for inspection at the Town Engineer's Office, Town Hall, Outremont, and copies can be obtained on payment of $5. E. T. Sampson, secretary-treasurer.

Toronto, Ont. — Tenders will be received until Tuesday, June 30, 1914, for the installation of cold storage plant at the Civic Abattoir, including ice machine equipment, complete, together with piping, cork insulation, floors of freezing rooms, cold storage doors and windows, electric wiring, plastering and painting, tracking, conveyor, motors, scales, racks for freezers, etc. Copy of specification may be seen, together with all information, at the offices of Wm. R. Perrin & Co., 530 King Street east, Toronto, Ont., or 200 Old Colony Building, Chicago, Ill.

Trade Gossip

The Dominion Iron & Steel Co. has received a 45,000 ton rail order from the Canadian Northern Railway.

The Collingwood Shipbuilding Co., has secured a contract from the Dominion Government for the construction of a steam hopper barge to attend the two dredges recently delivered at Sorel. The contract involves an expenditure of $160,000. The boat will be 165 feet long, 35 feet beam, and 14 feet deep, and will be constructed of steel throughout. She will be propelled by powerful engines of 800 h.p. The contract calls for completion in time to deliver the boat in the early spring of 1915.

The Toronto Board of Trade has decided to remove from their present premises to more spacious quarters. For this purpose an option has been secured on the whole of the nineteenth and twentieth storeys of the new Royal Bank Building at the corner of Yonge and King streets. The matter has been approved but requires the formal sanction and ratification of the Board of Trade council. When the scheme is ratified by the council it is also understood that the name of the Board of Trade will be changed to the Toronto Chamber of Commerce. This marks a very important step by the organization but one which is only in keeping with its progressive policy.

Toronto Litigation. — The Wellesley Hospital has entered action at Osgoode Hall against Williams & Cole, consulting engineers, Toronto, to recover $6,136.23. The defendants had supervision of the mechanical equipment of the hospital. The statement of claim of the hospital says: "In breach of their duty to the plaintiff, the defendant firm or one of the members thereof, without the knowledge or consent of the plaintiff, received from certain persons or corporations who contracted to supply the material and labor required for the equipment of the hospital, certain commissions or bribes, and the defendants thereby forfeited their right to payment for any services rendered by them." The amount of the alleged secret commissions is $4,494.23, while the balance of $1,642 is money which has already been paid the defendants for their services.

Catalogues

Electric Tools.—The Standard Electric Tool Co., Cincinnati, Ohio, are distributing bulletins G-7 and U-9, dealing with portable electric grinders and portable electric drills respectively. A comprehensive description is given of each type of tool with illustration. Each bulletin contains a table giving the capacity and other information for each type, also particulars of equipment furnished with each.

Derricks and Winches are dealt with fully in a bulletin being distributed by the Sasgen Derrick Co., Toronto. A full line of derricks and winches, for various purposes, made by the company, are illustrated and a description given of each type. The capacity, radius of action and price is given for each, while one page is devoted to particulars of steel blocks, rope and other equipment of a similar nature.

"Renewo" Valves are the subject of an attractive little booklet just issued by the Lunkenheimer Co., Cincinnati, Ohio. The principal feature of these valves, viz., the removable seat, is explained clearly in the reading matter and also by means of sectional views of the valve showing the constructional features. The illustrations are colored and embrace views of a complete set of repair parts. A price list is, included, of repair parts for various sizes of valves.

Valves and Hydrants. The Kerr Engine Co., Ltd., Walkerville, Ont., have sent us a new catalogue No. 5, dealing with the full line of valves and hydrants which they make. The various types are illustrated and include the most recent designs. The catalogue contains a full description of the majority of types together with price lists, while in some cases section views are given showing the constructional features. Other matter includes tables of flange dimensions and template drilling, telegraph code, etc. An index completes a very attractive catalogue.

Balanced Draft System.—Bulletin No. 12, entitled "Documents in Evidence," issued by the Engineer Company, New York. The bulletin contains a number of testimonials giving opinions in regard to the balanced draft system of furnace regulation. The illustrations include views of a demonstration with and without balanced draft, several prominent buildings where the system is installed, and a sectional elevation of a boiler showing the application of the balanced draft system of furnace regulation.

Push Button Control "Safety First" devices for industrial plants, is the title of a bulletin being distributed by the Canadian General Electric Co., Ltd., Toronto. The bulletin deals with the application of the C.G.E. push button control for electric motors in factories as a means of increased production and as a safeguard against possible accidents. Illustrations are given of a number of machines in operation, showing the location of push button control in relation to the starting apparatus.

Wood Working Machinery. — The Canada Machinery Corporation, Ltd., Galt, Ont., have sent us a series of bulletins as follows, 123, knife grinder; 124, knife balancing machine; 505 and 507, mortisers; 708, band re-saw; 817, box board matcher; 903, three-spindle vertical car borer; 905, three-spindle vertical boring machine; 911, horizontal boring machine; 919, post borer. Each bulletin has an illustration of the machine to which it is devoted together with a comprehensive description and a specification giving the principal sizes.

Book Reviews

"Steam Pipes, their construction and arrangement," is the title of a handy volume published by the Vulcan Boiler & General Insurance Co., Ltd., Manchester, England. The price of this book is only 25c., but it contains a lot of valuable information on steam pipes, prepared for Mr. C. Bullock, the chief engineer, by one of the company's assistant engineers. The text is based almost entirely on the actual experience of the company's engineering staff and should therefore be of special value to engineers in charge of steam plants; containing as it does, information obtained from exceptionally reliable authorities whose work brings them in touch with all phases of boiler and piping installations. The book contains 12 chapters, five of which deal with steam pipes and joints. Three of the chapters are devoted to such subjects as the velocity of steam and drainage of pipes, temperature changes and radiation losses, and pipe coverings, while the other chapters treat on equipment such as water separators, steam traps, and valves. The concluding chapters are devoted to a recapitulation covering the subject in a general manner. The volume contains 62 illustrations covering principally fittings and piping layouts. This book is one of a series of Vulcan engineering manuals.

The Elmira Machinery & Transmission Co., are opening an office and warehouse in Toronto, where a complete stock of transmission appliances will be carried. The office will be in charge of Mr. P. M. Laing.

The Ford-Smith Machine Company

THE GRINDER

illustrated is our Lighter Type Self-Oiling General Purpose Shop Grinder, a very handy, low-priced, capable tool, built in sizes for 12 to 18" Emery Wheels.

A thoughtful distribution of these in your shop will quickly repay their cost in improved output and labor saved running back and forth to a central machine.

The **HACK SAW** is also a General Purpose Machine of low cost. Well designed; splendid wearing features; strong and rigid. It is capable of doing a good deal more than the best blades will stand, and will give excellent service through a long life.

Our new catalogue will interest you, and is a mighty handy reference book for your Grinder equipment. Write to-day for your copy.

The First Universal Milling Machine

The original Universal Milling Machine was invented by Joseph R. Brown, of J. R. Brown & Sharpe, in 1861-62, for forming the flutes in twist drills. Although a very complete invention, our constant study of Milling requirements since that time has resulted in Machines of greatly increased capacity, strength, power and convenience

The Constant Speed Drive Type for Heavy Service

Our Universal Milling Machines with Constant Speed Drive are especially suitable for shops doing heavy tool work, where pulling power and rigidity are essential. Note the massive column and knee, deep table and rigid yet easily handled arm braces. The large diameter pulley delivers ample power, while speed changes are quickly made. Ask us about other production features.

Brown & Sharpe Mfg. Co.
PROVIDENCE, R.I., U.S.A.
Agents: The CANADIAN FAIRBANKS-MORSE CO., Ltd., Toronto, Montreal, Winnipeg, Calgary, Vancouver, St. John, Saskatoon.

PERSISTENCY IN ADVERTISING

One stroke of a bell in a thick fog does not give any lasting impression of its location, but when followed by repeated strokes at regular intervals the densest fog or the darkest night can not long conceal its whereabouts. Likewise a single insertion of an advertisement—as compared with regular and systematic advertising—is in its effect not unlike a sound which, heard but faintly once, is lost in space and soon forgot.—*Printing Art.*

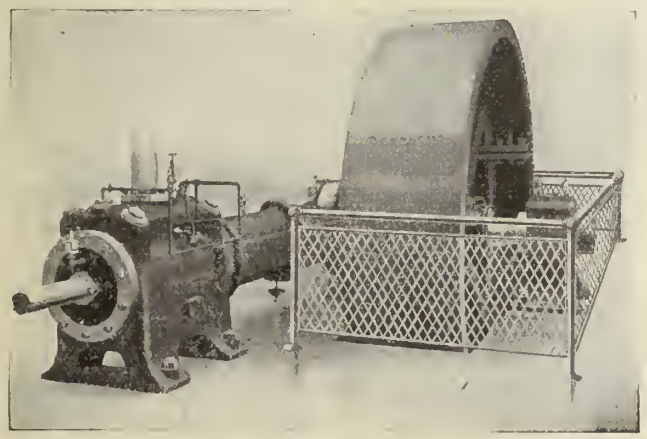
Make One Barrel Do What Two Barrels Did Before

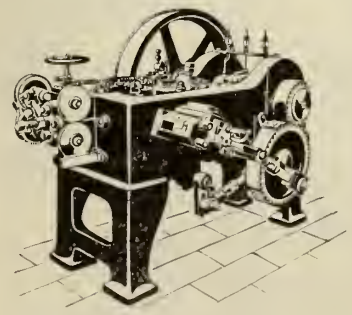


THE minute you install one Globe Tumbling Barrel you can pension two of your old-fashioned horizontal barrels and still do a wider variety of work—and do it a great deal better and many times faster.

GLOBE TUMBLING BARRELS

save time because they don't have to be stopped for filling, emptying or inspecting of the work. They save floor space, because they stand vertically and occupy little room—and they save money, because they require a smaller investment in barrels.

Eight stock sizes, $50 to $170. Our Booklet 2 contains useful information on tumbling — shows the different styles of Globe Barrels and tells what each will do. Write for a free copy to-day.



The Globe Machine & Stamping Co.
Cleveland, Ohio, U. S. A.

FOOL-PROOF YOUR SHOP

Protective devices for dangerous machines are the order of the day. The elimination of the sense of danger, among employees, pays for such equipment by promoting freedom of movement, resulting in more efficient service.

Little Giant.

DIES

make use of the famous

Wedge Grip

the strongest grip known to the mechanical world.

With cutting parts so firmly held—

With cutting edges so carefully tempered—

With cutting faces so perfectly formed—

With cutting teeth specially smoothed and finished—

The Little Giant Die

made friends at the very start and has kept them for over 30 years.

Try Them.

Little Giant DIES

Made by

Wells Bros. Co. of Canada Limited

Galt, Ontario

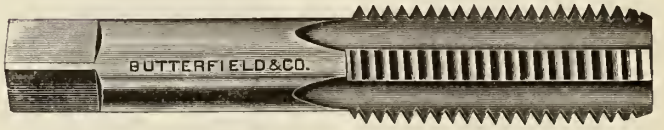
BUTTERFIELD

Taps, Dies, Reamers and Screw Plates

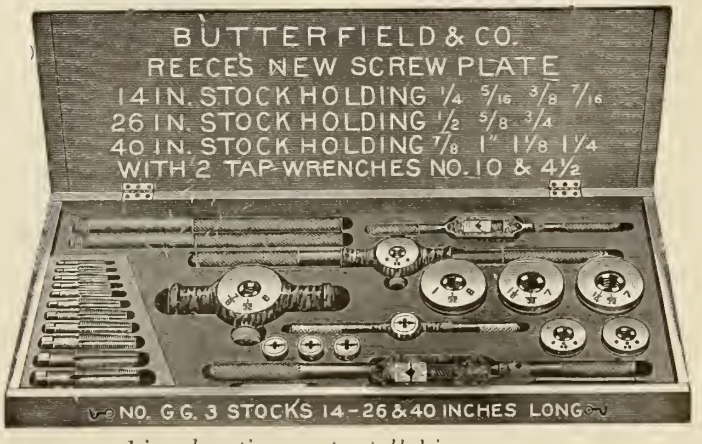
This is a line of tools that brings re-orders and re-orders.

They are made by workmen who have spent years in our service, and are the result of our aim to produce the finest tools on the market.

The high quality is largely due to the special hardening and tempering process that has given our tools a wider field of usefulness and a longer lease of life.



These tools will prove their superiority.



It's to your interest to give them the opportunity by trying them

Sold by leading Canadian Jobbers.

Wrenches, Ratchet and Basin.
Bemis & Call Hardware & Tool Co., Springfield, Mass.

get *full* value

Every line of type in Canadian Machinery is printed for a distinct purpose—SERVICE.

In no feature of this journal is the idea of service more notable than in the advertising. The constant study of shrewd advertisers is how to be of most service to you.

The more the advertising may be made to pay YOU—the better will it pay the advertiser.

You are not getting the fullest benefits from this journal unless you are a constant and careful reader of its advertising pages.

There is no feature more helpful—more important—more interesting.

Why not secure to-day the educative and personal benefits of your paper by keeping in intimate touch with advertising sections?

Look it over NOW—while you think of it.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

Books for Foundrymen

Three good Books that should interest Foundrymen who wish to know more about their work.

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price **$1.00**

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price, ... **$1.00**

PATTERN MAKING. By G. H. Willard. To which are added chapters on Coremaking and Molding. 214 pp., 312 illustrations. Cloth binding Dealing with the practical experience of foundry work, tools required; woods adapted for the work; turning; and all kinds of patterns. Price, postpaid .. **$1.10**

Do You Consider the Life of Your Tools?

When you grind tools with properly selected

Norton Alundum Grinding Wheels

you will obtain a cutting edge that will show the longest life. A wheel that will not burn, check nor "skin soften" the tool must be of a special temper as well as of the correct grain and grade. In producing this special temper, the highest skill in abrasive manufacture is demanded.

Six Busy Vertical Shapers

Large manufacturing concern proves wide usefulness of these distinctive tools. Highly efficient on die work as well as all regular slotter and horizontal shaper jobs.

Why There Should Be Some Busy Ones In Your Shop

Great Range. In the first place, the Vertical Shaper is a machine of great range and you should never have any difficulty keeping it busy. More adaptable and accurate than horizontal shaper or ordinary slotter.

Angular Adjustment of Ram is a new feature, advantageous on a large variety of work, especially in the working out of die clearances.

Convex, Concave or Irregular Surfaces are handled with greatest ease.

Swiveling Ram Head enables tool to be set in most advantageous position. Also all sides of work can be finished at one setting.

When Working to Line, tool enters work where line is scratched and line can be accurately followed.

Most Conveniently Operated. The controlling mechanism is constructed and located with view to affording greatest possible convenience in operating the machine. Ram may be started or stopped independently of driving motor or belt by means of clutch.

Stability and Accuracy. While the stability and power of the machine are such as to withstand the severest manufacturing service, the Vertical Shaper is a precision tool in every particular.

Two Sizes—With 6½" and 10½" maximum stroke of ram.

Write for new 12-page circular "Vertical Shapers" fully describing and illustrating both sizes.

The thoroughly successful performance of

Westinghouse Synchronous Motor-Generator Sets

is due to the fact that they have been designed after a careful study of power requirements, and long experience in the application of electrical apparatus. Some of their advantages are:

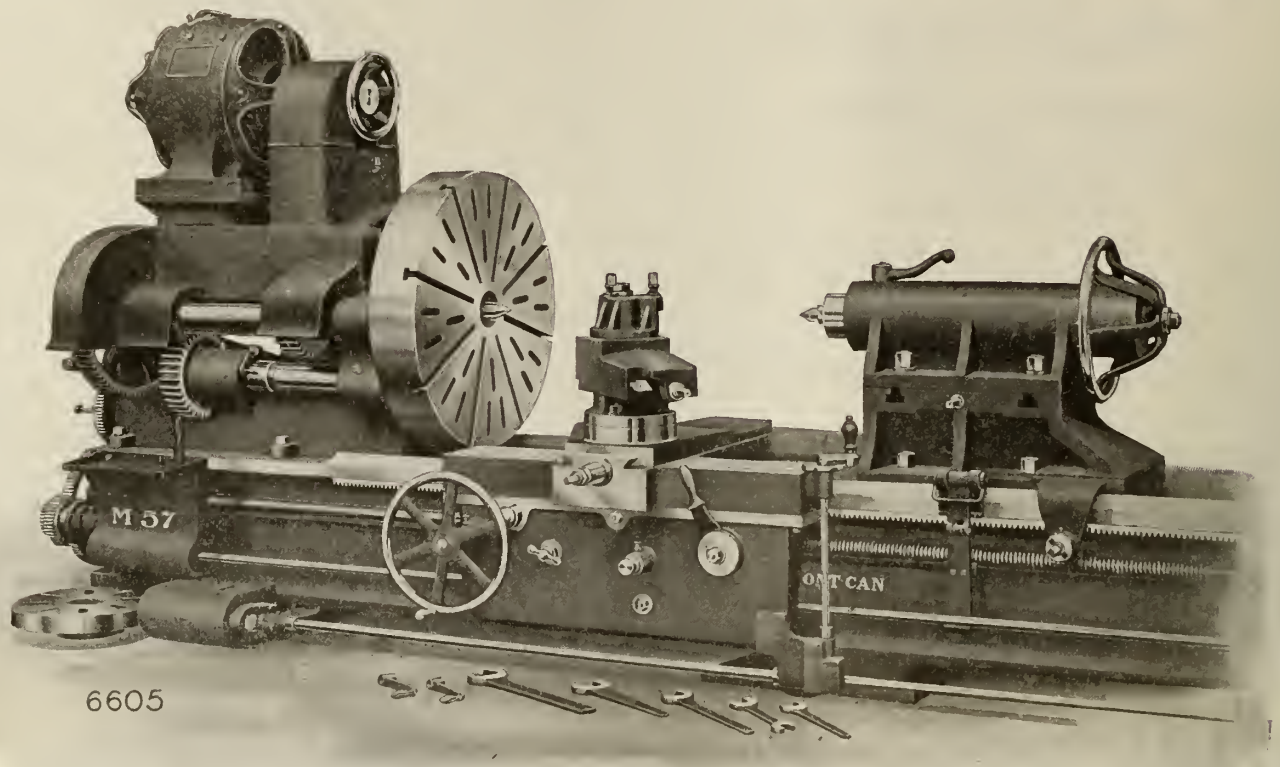
100 Kw. Westinghouse Self-Starting, Synchronous Motor-Generator.

Sparkless commutation over a wide range of load and overload.

High efficiency at all loads, particularly on fractional loads.

Simplicity combined with ruggedness.

Minimum attention required.



High power factor at all loads.

The advertiser would like to know where you saw his advertisement—tell him.

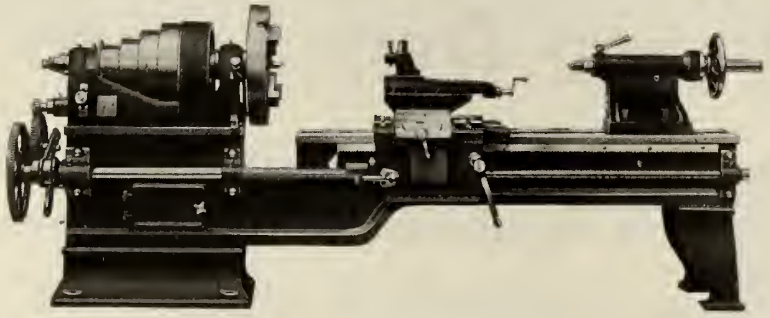
Figure for Yourself, Mr. Shop Superintendent

The monetary value of the increase in output and the decrease in maintenance and labor costs characteristic with the **LANDIS DIE.**

The line contact the chaser has with the work eliminates most of the friction at the cutting edge and makes it possible to operate at a speed from 50 to 100% greater than that possible with any other die.

The length of the chaser, the interchangeability of the chasers, and the right and left-hand threading features mean an enormous saving in maintenance cost.

The simple grinding operation at the front end of the chaser and the absence of annealing, hobbing and retempering mean a reduction in non-productive labor.



Write for Catalogue No. 21.

Combined Manufacturing and Tool Room Grinding Machine

Combining as it does both an **external** and **internal** grinder, its field of usefulness is practically unlimited. It is especially adapted to tool room service, for finishing such work as **straight** and **taper** spindles, arbors, rolls, male and female gauges, dies, reamers, plain, angular and forming milling cutters and a large variety of other work which can be held by either a face plate or chuck.

As a manufacturing proposition for accurately finishing straight or taper parts — external or internal—they assure accurate and economical production.

They will grind practically everything which can be turned on the lathe.

A New 16-Inch Shaper

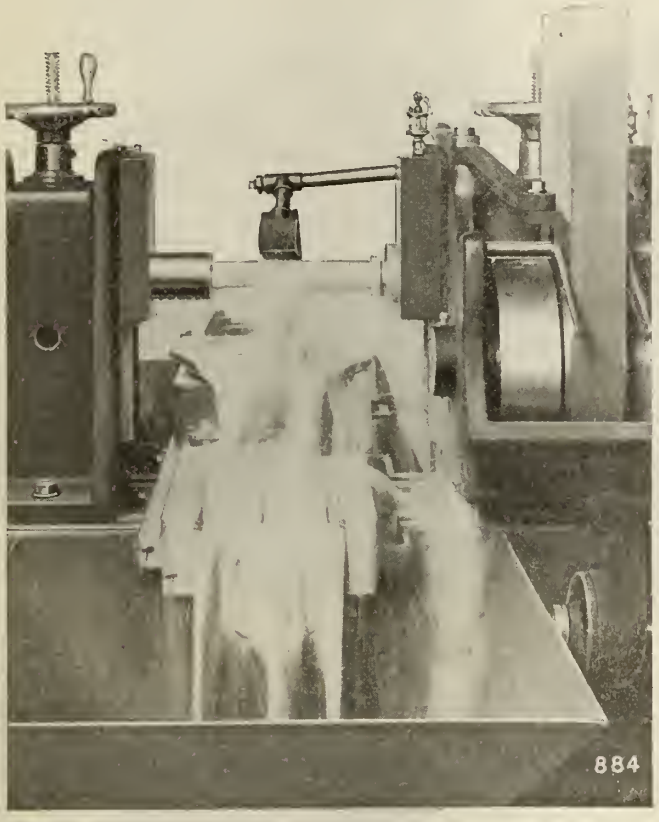
is the result of a long-felt demand for this kind of machine.

OUTSTANDING FEATURES:

The column is heavy and strong, well braced and ribbed.

The cross-rail and table are of proper proportions with large bearing surface, shown in cut.

All bearings and sliding surfaces are hand scraped to surface plates and are fitted with adjustments for taking up wear.



All feeds have graduated collars.

Changes of feed and position of ram are made from working side.

We'll be pleased to quote you prices and furnish any information required.

Guelph, Ontario

Stream Lubrication

Stream Lubrication on Cincinnati Semi-Automatic Miller: Hood lifted away from cutter to show construction.

The Cincinnati Stream Lubrication, or Cutter and Work Cooling System (patented), enables us to mill in actual practice three to five times faster than has before been possible.

The essential factor is the hood. This retains the lubricant around the cutter, forcing it to run in an inverted bath completely cooling every part of it. This device is patented.

The rush of lubricant from the hood washes away the chips so that they neither clog the cutter nor mark the milled surface. The cleaning of the jig or vise is thus reduced to a minimum with a corresponding saving in chucking time.

Send us blueprints of your work and we will show you how this new feature will reduce your milling costs.

A copy of "Cold Chips" is yours for the asking.

ACTUAL PRACTICE
5" Diameter Cutter, Speed 150 r.p.m., Feed 14", Slots ¾" wide—½" deep Machinery Steel.

CUT YOUR CAMS ON
GARVIN CAM CUTTING MACHINES

(Made in Four Sizes)

GARVIN 24″ Cam or Form Milling Machine.
Use Code—Acrimony

The Machine has many points of superiority, namely—

It will reproduce perfectly from the master cams, whether used for milling Face, Edge, Disc or Cylinder Cams. Will also do any kind of rotary or form milling, which makes it superior to the ordinary profiler.

The cross rail is adjusted vertically through twin screws—having ball-bearing thrust.

The upper horizontal surface of the rail and the opposing surface of the cross-slide, have a hardened and ground tool steel ball race carrying a long row of balls, thus supporting the weight of the cross-slide.

The thrust is taken care of by two similar ball races on the lower surface of the rail and the opposing side of cross-slide, thus making the slide travel back and forth with ease and the least friction.

THE WILT TWIST DRILL CO. of CANADA, LTD.

WALKERVILLE ONTARIO

"Stood the Toughest Tests On the Hardest Steel"

That's what users say regarding Detroit Drills and you'll say the same after a good stiff test.

The Studebaker Corporation has increased its drilling efficiency on one job from an average of five holes without a grind to nearly sixty—twelve times!

"Detroit Special" Twist Drills

tested by this same corporation, made the following record: At high speed in drop-forgings or nickel alloy steels they drilled from 50 to 100% more holes than any other make of drill entered in competition. In addition, there was a saving of from 15 to 20% in power.

With the testimony of actual results like this before you, can you afford not to give "Detroit" Twist Drills and other small tools a trial?

Write our special Service Department; let them analyze your drilling conditions and make suggestions. No obligation to you if you're not satisfied.

So certain are we that "Detroit" Drills will give *you* the best drilling service you have ever known that we offer to send you some on trial and refund the purchase price for any which fail to bear out our claims.

Write to-day for that trial order and ask for Catalog R.

A New Record for Dies

Wells Self-Opening Die

Patented Aug. 2, 1910.

Model V

While still in its experimental stage

204 Wells Self-Opening Dies (Model V) were placed on trial among various machiue shops of the United States, Canada, Eugland and Germany—a large portion being put to work under conditions where other automatic opening dies had "fallen down" absolutely. Out of those 204 dies, 197 made good iu every respect and are in operation to-day, giving fine satisfaction; to say nothing of the subsequent hundreds that are now iu daily use.

Saves its Cost in a Week

Because

It cau be operated at higher speed than any other type of screw-cuttiug die.

It saves the lost motion and time of "backing off" the work.

It saves wear and tear on machiuery and transmission (due to reversiug).

It produces more uniform work—prevents defective work—simplifies inspection.

It is adapted to a wide range of machines, working conditions and metals.

Changes from one cutting size to another are made in a minute.

The most intelligent and economical little steel workman that ever entered a shop.

"Modern" Chaser Grinders

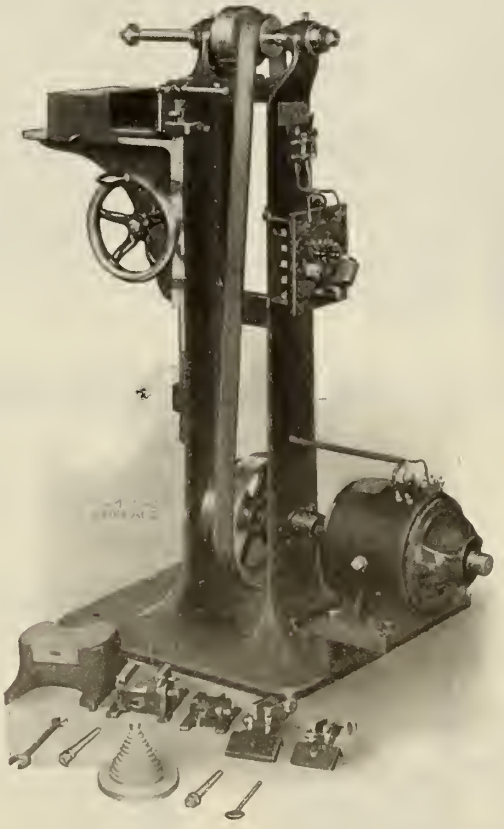
Your attention is called to the remarkable saving that is possible with the machines illustrated herewith.

"MODERN" CHASER GRINDER
(BELT DRIVEN)

Machine Showing Full Equipment

Wherever this Machine has been installed, it has resulted in an enormous saving of time over previous methods of grinding chasers.

If you are interested in reducing the cost of Chaser grinding, it will pay you to investigate the merits of the "Modern" Chaser Grinder.



The "Modern" Chaser Grinder is adapted for grinding chasers for any style or make of die and is equally efficient in grinding bolt die chasers. We also furnish a number of special fixtures with this machine, by the use of which Spring Dies, Pipe Dies, Spiral and End Mills, Milling Cutters, Hobs, Reamers and Taps may be successfully ground.

This machine is simple in construction, inexpensive to maintain, easy to operate and it will save much valuable time in the grinding of your small tools.

The "Modern" Chaser Grinder must command your interest if you are using threading dies. We say this is the "most useful machine ever built" advisedly, and believe that you will agree with us in this statement after you have considered the distinctive features and advantages of the "Modern" Chaser Grinder.

Its economy will be quickly appreciated when consideration is given to the amount of time wasted in grinding your Chasers by hand. It is easier, quicker and better to grind your cutting dies and chasers with a "Modern," as ninety per cent. of the die troubles encountered are caused by incorrectly ground chasers; then, your wasted time is saved and production is increased, and at the same time your threaded work is accurate and uniform.

Every Mechanic Should Have a Starrett Speed Indicator

Men who work about machinery should have this indicator for taking speed on engines, generators, turbines, motors, line shafting, grinders, etc. It is the simplest, most accurate instrument made. It is especially valuable in taking speeds when computing engine horse power, etc. With the rubber wheel attachment it may be used to figure surface speeds. It indicates highest speed without heating. The parts are enclosed like a watch.

Made in three styles, prices $1.00, $1.50 and $3.00.

Send for catalog No. 203 to make your selection.

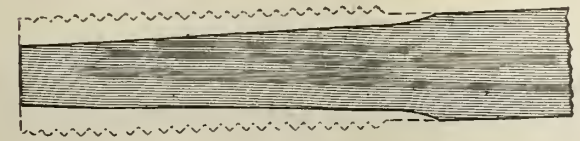
If you don't know the *LIGHTNING* Tap

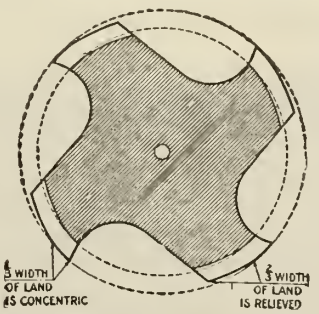
Send for this little book which describes its salient features.



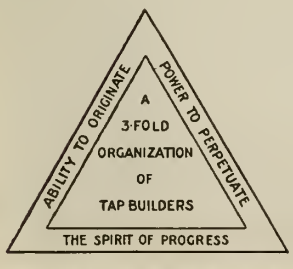
The *LIGHTNING* (Trade Mark) Tap stands pre-eminent in the mechanical world—a monument to the creative ability, perpetuating power and progressive ideals of the Wiley & Russell organization.

The only Tap considered good enough to imitate.

IF A BETTER TAP IS EVER MADE W. & R. WILL MAKE IT.



Special Features



The flute is fortified against severe twisting strains by a graduated depth which makes the "backbone" strongest where the strain is greatest.

When you buy a **Lightning** Tap you buy something beside metal.

Two-thirds the friction surface of ordinary taps is abolished by special eccentric relief, without weakening the support to the cutting edge. (See sketch).

"GRIDLEY" SINGLE SPINDLE

Gridley Automatics

save time and labor and ensure accurate production.

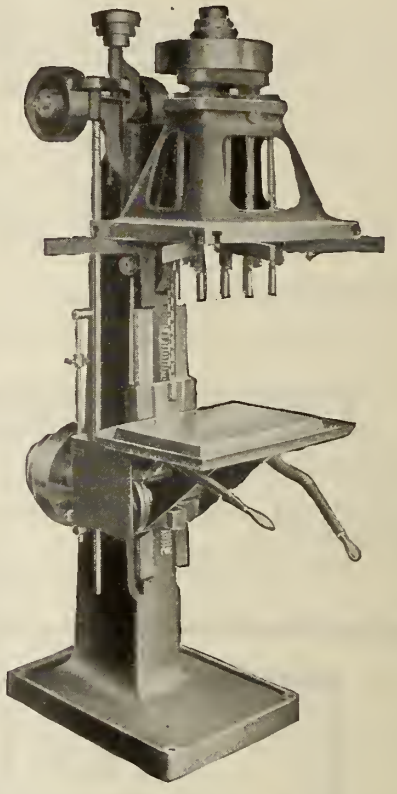
They handle work of greater length and of more complex character than can be machined on other automatics.

Tools are held rigid without overhang—they cannot spring or wabble.

Greater ouput results because the general design of these automatics, and the type of tool used, permits heavier cuts and coarser feeds to be taken.

Much labor is saved because **one man** can operate from **three to six machines at once,** and can use tools tandem when rapid production is necessary.

We manufacture both Single Spindle and Multiple Spindle automatics.



A card will bring you Catalogue by return mail. Write!

16 in. Lever
POST DRILL

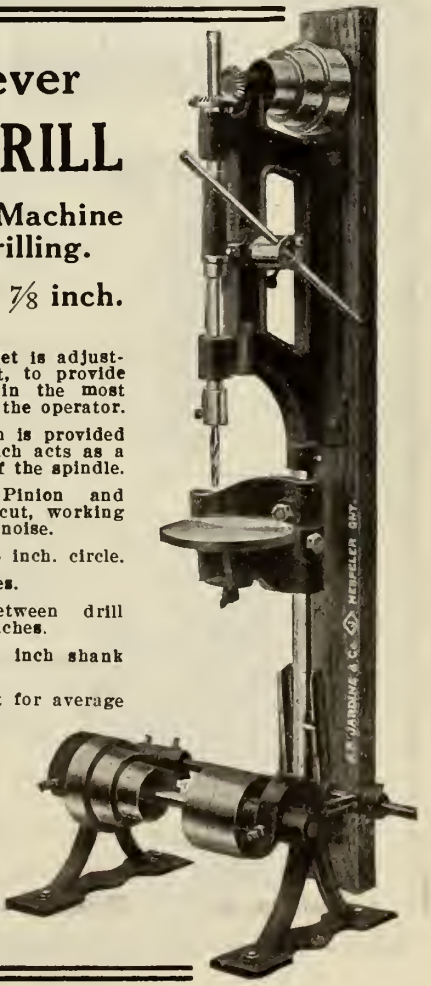
A Giant Little Machine For Light Drilling.

Will drill up to ⅞ inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

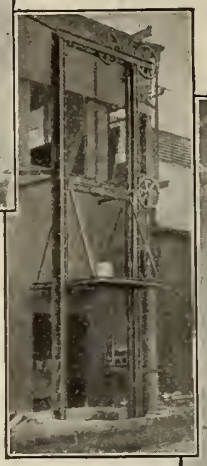


Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.



Speed of countershaft for average work, 300 per minute.

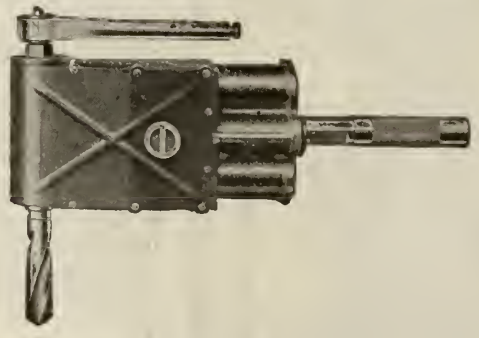
Cleveland Riveting and Chipping Hammers



Fitted with either Inside or Outside Throttle Lever as preferred. They are made in several different sizes and weights for all classes of work.

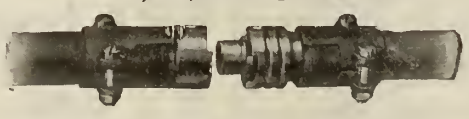
The Riveting Hammers have a range in rivets from ¼ inch to 1½ inches.

CLEVELAND CORNER DRILL For Close Quarter Drilling.

The Body of the Cleveland Corner Drill is in one piece with cylinders and valve chambers cast integral which insures absolute alignment of working parts.

The Driving Crank is mounted upon Annular Ball Bearings which reduce friction to a minimum. Made in two sizes, Nos. 38 and 49, with Nos. 3 and 4 Morse Taper Sockets.

Either size machine will drill or ream within 1⅛ inch of side wall or corner.

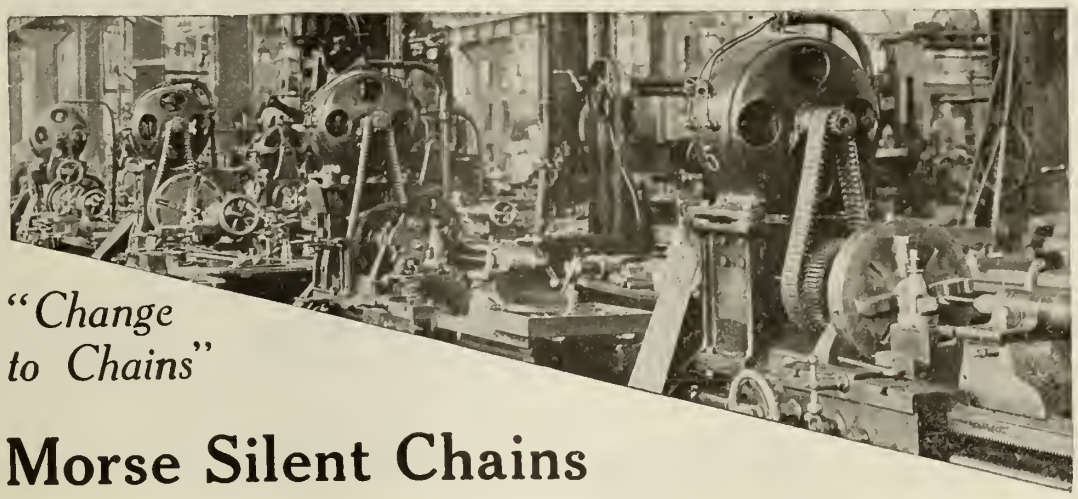


IN STOCK:—Sand Rammers, Bench and Floor, Portable Emery Grinders, Air Drills, etc.

BOWES AUTOMATIC AIR HOSE COUPLINGS

Over 1,000,000 in general use.

¶ They are instantly connected or disconnected.



¶ They are absolutely tight under all pressures.

¶ They are interchangeable in all sizes commonly used.

¶ They quickly pay for themselves by stopping costly leaks.

Cleveland Pneumatic Tool Co. of Canada, Ltd., 80 Duchess St., Toronto, Ont.

"Change to Chains"

Morse Silent Chains

THE drives shown above, after almost eleven (11) years' daily service on practically continuous "rush work" schedule, are to-day more efficient, more reliable, more durable and less noisy, and require less attention than drives of any other character when new.

Just let that statement sink in, Mr. Master Mechanic, and remember also that there are quite a few things besides "price" to consider when selecting a drive for your machines.

Can't we get together on the subject right now? Write for particulars and publication No. 12.

PRINCE'S BAY MACHINE AND BOAT WORKS

All kinds of Machines and Marine Work, Launches Built and Overhauled. Marine Engines installed. Automobile and Marine Engine Repairs and Supplies. Winter Storage.

Prince Bay, Staten Island, Oct. 24, 1913.

Magnolia Metal Co.,
New York, N.Y.

Dear Sirs:—

Your letter of the 23rd received. I always carry MAGNOLIA ANTI-FRICTION METAL in stock, and have been using your Metal for past TWENTY years, and have always found it the best Metal I could get for Crank Shafts and Connecting Rods; on Marine Engines, Stem Bearings, Propeller Shafts, and many other bearings.

There is here to-day Crank Shaft and Connecting Rod bearings that I put in FOUR years ago, and they have been running daily ever since; the wear is so little to-day that there is no perceptible lost motion in them. Also SIX years ago I put in bearings in a Marine Engine now in Guantanamo, Cuba, and they are still running O.K. These are all heavy working engines. I have put in hundreds of bearings of MAGNOLIA ANTI-FRICTION METAL, and all gave good satisfaction, so there is no need of writing me about your Metal, because I assure you if it did not fill the bill I would not use it.

Yours very truly,

A. G. Marscher.

Figure Belting Cost This Way

Belt Efficiency Card

Kind _____ Made by _____ Width _____ Ply_____

Date of Installation	Location and Service	Date Taken Up	Cause for Taking Up	Time Consumed Minutes	Cost per Minute of Shut Down	Total Cost of Shut Down	Date Removed	Number of 11 hr. day Service

After you've figured the lost time—the lost motion—the lost production—the lost money—then add the original price of the belt. **That's what your belting really costs you.**

So, there's a big difference between **belt** cost and **service** cost. Service is what you pay for.

When buying belting remember that whatever the purpose, there is just the very Goodyear Belt for it.

And Goodyear belting is made on a **service** basis. Exact, actual conditions are studied long before any Goodyear belt is made. Thus every Goodyear belt is a **service** belt through and through. No Goodyear belt is made to "meet a price." A poor belt would be a costly proposition, even if it could be had for nothing.

Service is what men seek in belts. Service means efficiency. Efficiency means economy. Economy means satisfaction.

"GOODYEAR"

Men call it the master belt. It is designed for heavy main drives—for maximum power delivery **all** the time. Won't besitate under the heaviest load. It is the busy belt. A belt that pays its way, through day-in-and-day-out service and dependability.

"Goodyear" is made of the finest Para rubber friction and best quality duck woven to meet the most gruelling service. It lasts and "delivers" for years.

GOODYEAR TORONTO
RUBBER BELTING

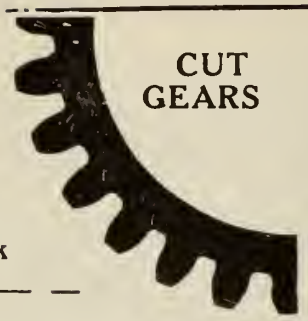
PACKING, VALVES, HOSE

These experts have also designed packing valves, and hose for every exact purpose. Goodyear quality dominates in mechanical goods as in tires.

And these products are Canada-made—at the Goodyear factory at Bowmanville where **service** is the one standard of super excellence.

OTHER GOODYEAR BELTS

These cover every service—for large pulleys and small—light work and heavy—fast work and slow—steady loads and intermittent—conditions usual and unusual. Whatever your belt problems, remember that Goodyear efficiency experts have already solved them.



CONSULT GOODYEAR EXPERTS

Whatever your equipment problems, consult Goodyear efficiency experts. Doing this costs you nothing—puts you under no obligation. These men have been solving just such problems as yours for years. They will be glad to tell you just **what** Goodyear product—and **why**! Ask questions. You must be **shown** before you can be sold. That's the Goodyear way. Write to-day.

GEARS

Cut This Out
More coming each month.

Gear Data for Your Note-Book

"DON'TS" ON THE USE OF GEARS

From The Hamilton Gear & Machine Co., Toronto

DON'T run two soft, low carbon steel gears together. They will not wear well. Use harder steel or two different metals.

DON'T use molded or cast tooth gears for any but the slowest speed and roughest service. Use Cut Gears.

DON'T let oil or water on a raw-hide pinion. For damp or oily places use an extra quality of hard white or grey fibre.

DON'T use cast iron pinions. A pinion tooth is weaker than a gear tooth of the same metal. Therefore use a tougher material for the pinion.

DON'T use brass for gears. Three cents a pound more will give you bronze, which is more than double as good. Use No. 1 Government Bronze;—88 per cent. copper; 10 per cent. tin; and 2 per cent. zinc.

DON'T forget that the Hamilton Gear & Machine Co. has the only real gear shop in this country; that their modern plant with heavy up-to-date machinery is at your service in any emergency. Use telegraph or long distance 'phone.

DON'T run gears unguarded, if there is any possible way to put a shield around them. This is to protect the gears from damage, whether you value your fingers or not.

DON'T omit details when asking prices or placing orders for gears. The fuller the information the better the price and delivery you will get.

Management--The Strenuous or Rule-of-Thumb Type

By E. St. Elmo Lewis *

The present is the first of a series of three articles which will deal with the subject of management as exemplified in three different types of men—the strenuous, the systematic and the efficient. The points brought out relative to the useful accomplishment of each are worthy of careful study.

IT IS important for us to recognize in the very beginning of any consideration of the question of costs, that a cost system does not unfold itself as a logical consequence of starting a business with a bookkeeping department. A cost department is an entirely different unit. A cost system is not based upon the pre-determined scheme of things which flow from one to another in an inevitable and logical sequence. A cost system is the reflection of a man's mind, of his manner of thought, of his education, of his sympathy, of his training and experience, of his ability to manage, to analyze, to synthesize, to coordinate, to harmonize, to grasp things in detail and in the large. We understand that cost keeping at its best is an efficient method of determining exactly what time, work, and material is put into the production of any marketable energy, commodity, or service.

Do not make the mistake of thinking that manufacturing is limited to things that you can weigh on scales or measure with a foot rule. The electric light company manufactures a product as well as the automobile manufacturer. The railroad company manufactures a product as well as the hat manufacturer. The department store canufactures a product, and so does the doctor, the lawyer, and the advertising manager.

The mere fact that in some of these a definite standard of measurement has not been obtained, does not preclude the idea that their work can and must be measured and its value approximated. Therefore, no man should adopt the attitude that they can't be measured. Some people think that advertising can't be measured. This is not because it can't be measured—it is because their education, their experience has not progressed far enough to give them the ability to measure it. The savage seeing the lightning in the sky would probably find it possible to imagine that the electric fluid could never be measured, but it is being measured. The main purpose of any cost-keeping system is to find measures for many things that can be measured by the ordinary bookkeeping processes, or by the mere senses of careful foremen, and thereby arrive at standards of production for guidance in forming policies. If a cost system be a reflection of a man's mind, or of the minds of a number of men, it becomes very important to find out what kind of men they are.

*Advertising Manager, Burroughs Adding Machine Co., Detroit, Mich.

Types of Men—The Strenuous.

There are three fundamental types of men in the world. There is the strenuous type, the systematic type, and the efficient type. These fall into divisions, determined by the methods they use and all of their mental and physical equipment. All these types are reflected in cost keeping systems. The strenuous man, for instance, is the hard working type. He may be called the sweat type. His philosophy in life is embodied in "do it now." He is a doer worker of muscular type. We have had thousands of them in our factories as managers. They are busy—busy-ness is business with them. They are the men who get down to the office at six o'clock in the morning and work until ten o'clock at night. They never think of the factory hygiene, of lighting, of plant planning, of functionalizing, of standards, of education. Their ideal is hard work. They take literally the proposition that man must gain his livelihood by the sweat of his brow. When everybody worked that way, of course, strenuously was the order of the day. It didn't make any difference—the world was on a sweat basis. Then the man who was the most strenuous made the most money in feeding a hungry market. It was a brute force—physical stamina that won. One unskilled laborer was as good as any other unskilled laborer; but when skill came into competition with the man at the bench; when brains, forethought, planning and thinking came into competition with the strenuous manager, then came the demand for protection, and the outcry against competition.

Gospel of the Strenuous.

The purely strenuous type can be seen in a bookkeeper who works hard, who is loyal, who fusses and fiddles over things; but the rule-of-thumb or strenuous man is the type that believes if he lowers his cost each month or each year, he has gained highest efficiency. He maintains that his business is different from any other business. He thinks the only thing worth taking from anybody else is to steal a patent, or to steal a man who has shown that he can do more than anybody else.

The rule-of-thumb man says "each man is different," that "you can't teach salesmen," that this man who is doing things so successfully has an unusual faculty possessed by nobody else. His apprentices learn by doing (the good and the bad things); he hasn't any school of workmen (they already know). A school for teaching salesmanship would make him laugh—and yet he is buying his cash registers, his adding machines, his insurance policies and his loose-leaf devices, if he has any, from salesmen who have been taught in schools how to sell the produce to just such a man as he.

The rule-of-thumb man never joins business organizations except to be a good fellow—he never makes a research to find out new things—he calls it high brow theory. You can't tell the rule-of-thumb man anything, because you can't tell any man anything that he doesn't know. The rule-of-thumb farmer plants by the almanac and reaps by the grace of God. The rule-of-thumb mechanic has learned his good and bad methods by the side of an older mechanic, who learned his good and bad methods from another. Each loses a certain amount of efficiency in the process of learning. He doesn't study trigonometry or geometry. He doesn't care anything about such high-brow stuff, but he is a loyal member of his organization and talks against capitalists who don't do anything.

The rule-of-thum employer cares nothing for co-operation. He sees nothing but competition. The only kind of organization he wants to belong to is an anti-union organization. He is an anti-laborer; he believes that you have to use the big stick, that you have to drive men instead of lead them, because—well, you see, that's the way it always has been done, and my father did it that way.

The rule-of-thumb banker, the rule-of-thumb retailer—all of them have ingrowing businesses, because their education has never gone beyond the confines of their own particular experience. They can imitate, but they can't adapt. They don't really think about their business—they only think about the dollars and cents. They don't think about men, but they think about machines. Their costs are necessarily nothing but approximations, more or less distant, of an ideal set by the men who have worked under different conditions of a more or less distant past. In such a plant you see do-it-now signs all over the place. In such places salaries are raised by the time clock and calendar. Such a manager has no methods of measuring men's

efficiencies because he doesn't know what those efficiencies are.

His ideal of a cost system is a crude method by which the pieceworkers can be prevented from getting more than he thinks they are worth. He says no laborer is worth more than $2 a day because that's all he has ever paid, and he is perfectly satisfied if a salesman increases his business 10 per cent. a year in his territory. If his competitor lowers prices, he wonders where his competitors steal the raw material and how long he can continue to lose money. It never occurred to him that a man can beat him at his own game and make a fortune in the process.

He doesn't analyze his business and its possibilities to find out the real reason for his success or failure. He hasn't time. He is too busy doing things. In the hiring of people, his ideal is to try them out—see what they can do. The try-and-fail method is a gospel to him. He solemnly asserts that you can't tell what any man is able to do. That other concerns are foretelling and finding out what types of men are necessary for certain jobs, are pre-determining what men will fit the jobs and then getting the men to fit the jobs, is a joke to him.

Of course, you can't tell him anything about it, because he doesn't know anything about it. He doesn't know anything about the idea because he has never seen it at work. If he did see it, he would probably dismiss it with—the employment manager was better than usual, but as for finding law or principle in any course of action, he dismisses it with—it is the man who is doing the work, and the man who is getting the results.

The rule-of-thumb manager prides himself upon knowing his business. He never thinks of using outside counsel. If a man would suggest to this type of mind that there is a better way in which to grind a valve, his first question would be—how many valves have you ground? In other words, his attitude of mind is of the man looking in the mirror when he is looking for all the reason for success. It is a type of mind of which we have had entirely too many, and which competition and the efficiency of skilled minds, applied to skilled work, is gradually forcing out of business. These rule-of-thumb managers act as the priests of old, adopting a precedent as a sacred flame which has passed from hand to hand, from generation to generation, each keeping it inviolate, never changing it, until it becomes a sacred tradition before which youth and skill and brains and power must bow in submission. The rule-of-thumb manager is always a liability and never an asset. He may be popular, he may have succeeded, he may be succeeding, but, just as inevitably as the sun rises, his day is done.

Concerning the Bolting-Up of Wood Framework

By W. J. Horner

The particular feature dealt with in this article is the insertion of bolts in the ends of wood rails, the latter being connecting pieces between a pair of cast iron standards, the whole constituting types of machines for winding, beaming, etc., in the manufacture of textile fabrics.

FOR several years the writer was employed in a shop where machines were built for winding and beaming and

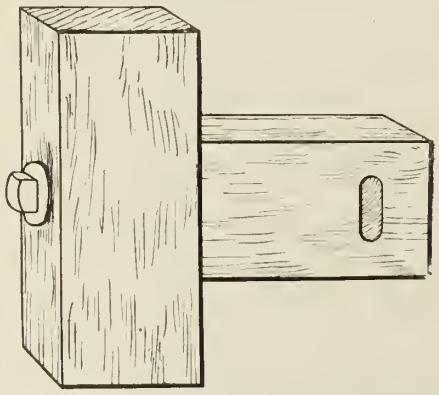

FIG. 1. BOLT WITH ITS NUT INSERTED IN THE WOOD.

various other operations in connection with the making of textile fabrics. This was in the Kensington district of Philadelphia, Pa., U.S.A., where a large amount of textile work is done. When there was no pattern work to be done I used to assist in the general woodwork of the shop, and, as the same kinds of work were being constantly repeated, it was all done on a system evolved by long experience. The particular feature dealt with in this article is the insertion of bolts in the ends of wood rails. A large proportion of the machines built consisted primarily of a pair of cast iron standards or end frames connected by four or more wood rails of ash or maple, the length of these rails depending on the character and size of the machine. Machines for some purposes were entirely of wood framework bolted together.

The bolting was done, as shown in Fig. 1, by inserting the nuts in holes cut in the wood, these holes being plugged after the nuts were in. In a case like Fig. 1, where wood is bolted to wood, the joint would be tenoned to prevent twisting and keep the faces flush, but in fitting wood to metal the joint was a plain one.

Fig. 2 shows a side and edge view of the end of a tenoned member with bolt

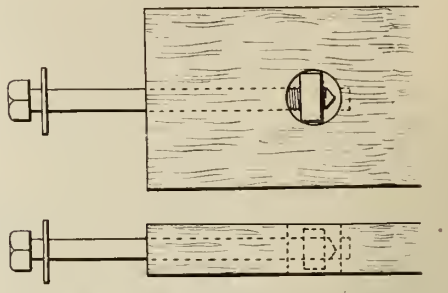

FIG. 2. SIDE AND EDGE VIEW OF RAIL END WITH BOLT INSERTED.

inserted. The other member would be mortized to fit the tenon. The bolts used have square heads, pointed ends and rectangular nuts longer in one direction than in the other. The pointed ends enable the bolt to find its way into the nut easily. Large washers are used at the heads, but none at the nut ends. The insertion of a bolt in this way looks difficult and complicated, but a man accustomed to the work can do it in a few minutes, and it makes a strong and neat union.

First, the distance from the end of the

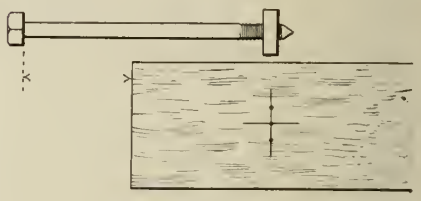

FIG. 3. FIXING DISTANCE FROM END OF RAIL TO NUT.

rail to the recess for the nut is marked. A bolt long enough to avoid risk of tearing out is selected and laid on the rail, while the distance between the end of the latter and head of the bolt is measured. This distance is indicated by ticks in Fig. 3, and corresponds with the thickness of the piece to be bolted to the end of the rail. In the case of an iron standard it might not be more than 5/8 in., but for a wood post the bolt would have to stand much farther out, and, of course, its total length should be more. It is sufficient to mark the centre

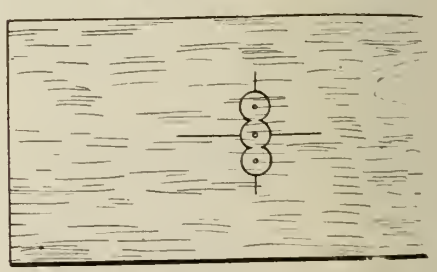

FIG. 4. HOLES BORED FOR NUT RECESS.

line of the recess, as in Fig. 3, and a centre line at right angles to this is gauged across it. The best surface of the rail is selected for the front or up-

per face, and the nut inserted from behind or below.

Another thing to consider is camber or curvature, which nearly always exists in long rails. The convex side should be upwards so that subsequent sagging by its own weight will correct it and make possible development of curvature in the opposite direction less pronounced. These things decided, the nut hole is indicated by two crossing centre lines, as in Fig. 3, and is bored with a centre bit to the correct depth, three holes being bored, as in Fig. 4. The sides of the bored recess are then cut straight with a chisel and the ends left semi-circular, extending beyond the length of the nut.

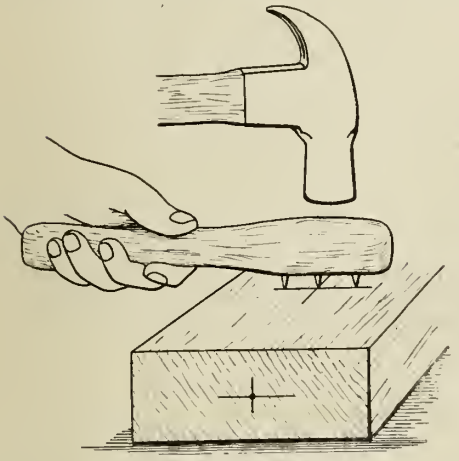

FIG. 5. MARKING CENTERS FOR BORING.

The reason for semi-circular ends is partly to save the trouble of cutting square, and partly because a hole with square ends would have to be cut a trifle longer than the nut, and one or both ends plugged to adjust the nut. Semi-circular ends allow a little adjustment, and are as easy to plug as square ones.

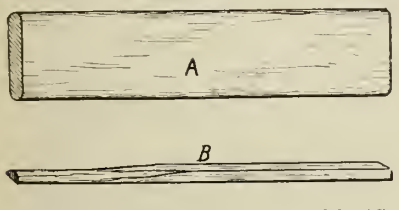

FIG. 6. STRIPS FOR PLUGGING.

The sides of the nut recess are chiseled before the bolt hole which runs into it at right angles is bored. The boring for the recess was done under a drill press adjusted for the exact depth—that is, to the centre of the wood, plus half the thickness of the nut. The bolt holes were bored on a horizontal boring machine. This boring could be done by hand, but would be comparatively slow and hard work, especially in hard wood and when a large number of pieces are being dealt with. Of course, there are cases where bolts are required out of centre, and then the nuts would be put in from the nearest side. In very heavy rails two bolts were used at each end.

The bolt centres are gauged on the end of the wood and centre punched. Fig. 5

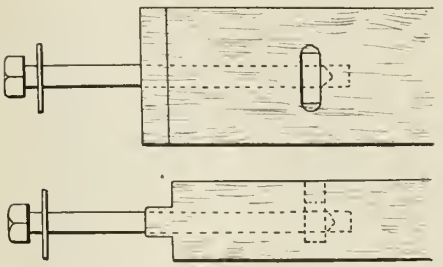

FIG. 7. NUT INSERTED IN ROUND HOLE.

shows this and also an appliance for marking the three centre-bit holes simultaneously at correct centres to suit the nut. This appliance was simply a piece of hard wood with three steel points inserted, and it was set with its centre point on the intersection of the lines, as in Fig. 5, and given a light tap with a hammer to mark the centres.

Before plugging, it is necessary to see that the bolt enters the nut easily. Bolt holes frequently run more or less out of centre, and the nuts have to be adjusted to suit. If the hole comes slightly too low or too high in the nut recess it often means deepening the latter or putting a bit of chip or cardboard in the bottom to keep the nut high enough. With the bolt in the nut, a strip of wood, B in Fig. 6, is pared with a chisel to go into the semi-

FIG. 8. CURVED RAIL WITH ENDS BEVELLED SO THAT BOLTS WILL PULL IT STRAIGHT.

circular spaces beyond the ends of the nut and a portion of it snapped off in each level with the top of the nut. The hole above the nut is next plugged with a piece planed to the shape, as at A in Fig. 6. This gives an end grain plug, which is conspicuous, but it has the advantage of being planed in a strip, from which a number of plugs can be cut, and also is easier to extract if the nut has to be taken out. This plug is driven in tight with glue and sawn off and trimmed level. It is best to have the nut the least bit slack in every direction, and the plugging is done with the bolt in the

FIG. 9. RAIL END BEVELLED TO LOWER ONE LEG OR RAISE THE OTHER.

nut. Bolt holes should be about 1/16 in. larger in diameter than bolts, and the latter must enter the nuts without binding against the side of the hole, otherwise it is difficult or impossible to get them into the nuts at all in bolting up the structure.

A quicker way of inserting a bolt in a thin rail is shown in Fig. 7. Centre lines are marked as before, but instead of boring three holes for an oblong recess, a single hole just large enough to take the nut is bored right through and not plugged. This, of course, looks rough, but is quite effective. It was done only in a certain class of work where the pieces which received the nuts were wide and thin.

In marking out a number of pieces for bolts, gauges are set for marking the centre lines on face and ends, and direct measurement from the bolt itself, as in Fig. 4 is only done in the first instance, the distance being gauged if a number of pieces have to be done together.

Two rather remarkable features in this kind of work are that the pull of the bolts is utilized sometimes to straighten or give a slight upward camber to a long horizontal rail, and sometimes to vary the height of the feet when a first trial shows that the structure rocks instead of bearing evenly on the floor. This latter only applies to short structures, as rails of great length have sufficient flexibility to adjust the feet of the end frames to the floor. Both of these things depend on the way the ends of the rails are cut. They are cut square at first, but this may have to be modified to meet either of the conditions just mentioned.

Fig. 8 shows how a curved rail is treated to pull it straight. A few shavings are planed off to give the ends a slight bevel, as indicated by the dotted lines; then when these ends are pulled up tight by the bolts against unyielding end frames, the effect is to set up a strain throughout the length of the rail which forces the rounding side in and the hollow one out and straightens the rail if the correct bevel is given to the ends. A straight rail can be cambered on the same principle. Often a rail is straight in a portion of its length and curved in another, and this usually means that the curve must be taken out by treatment at one end only.

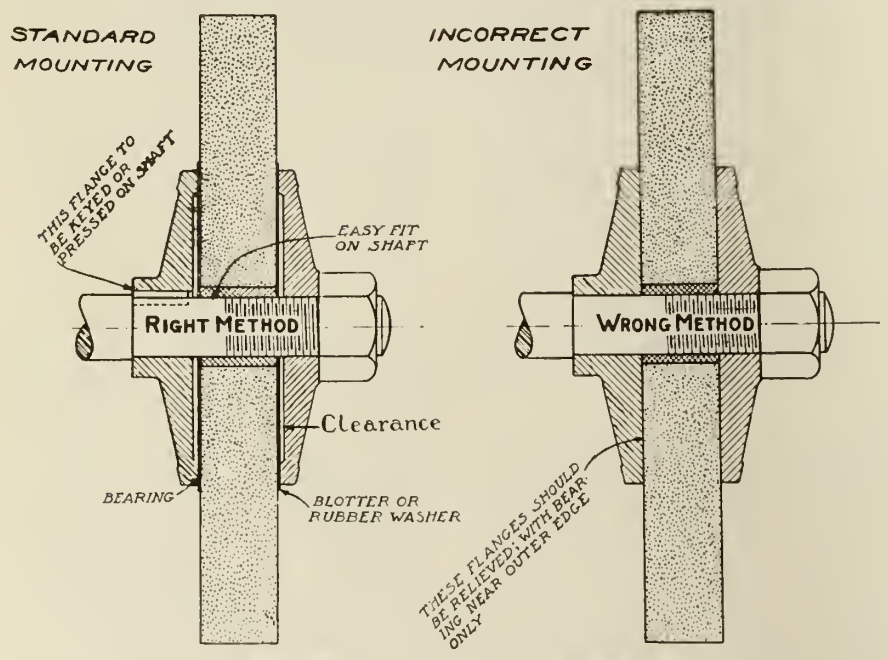
Fig. 9 shows how the raising or lowering of a leg or foot is accomplished. The leg at the left-hand end is off the ground, but would be brought down by cutting the end of the rail, as shown, and tightening the bolt until the end came in contact at the place shown slightly open. This would also have the effect of slightly cambering the rail at that end, and sometimes it might be advisable to treat the other end instead, cutting it the opposite way, which would give the same result; or both ends might be treated, half the amount of bevel being removed from one, and the other half the opposite way from the other. The fitting of wood rails between cast iron end frames is complicated also by the fact that the metal surface is seldom true.

Grinding Wheel and Grinding Machine Safeguards

Being the report of the committee appointed by the National Machine Tool Builders' Association to consider grinding wheel and grinding machine safeguards and matters relating thereto. The cuts accompanying this article are from photographs furnished by the Norton Co., Worcester, Mass.

ALL wheel manufacturers, to the best of our belief, subject grinding wheels to a speed test. This speed test consists of revolving the wheels at higher speeds than they are recommended to operate. Your committee sees no reason for changing present recommended operating speeds and suggests that approval be placed on the practice of wheel manufacturers in subjecting wheels to a speed test. The recommended operating speeds should not be exceeded by the user, with the possible exception that cylinder wheels, when used in a chuck which incloses at least three-quarters of the wheel, can be operated at speeds recommended for straight wheels.

Control of grinding machine speeds so far as related to speed of grinding spindle.—Where cone pulleys are in use, belt-locking devices or some other device to prevent the belt from slipping to a smaller pulley should be used. If a wheel spindle be driven by a variable speed motor, speed control of the motor should be inclosed in a locked case or some device should be used which prevents motor from being run at too high speeds.



Mounting of Wheels.

Size of Flanges.—On floor and bench machines, straight flanges should be at least one-half the diameter of the wheels. Safety flanges (sometimes referred to as tapered, bevelled or protection flanges) should be of such size that not more than 4 in. of the wheel projects beyond the area of the flanges. Designers of cylindrical, universal, internal and wet tool grinding machines have found it advisable to make use of flanges smaller than half the diameter of the wheel. On the types of machines mentioned, a well-designed, substantial protection hood should always be used unless the nature of the operation absolutely prevents its use.

Washers.—Washers of some compressible material which are slightly larger than the flanges, should be used between the wheel and the flanges. Such washers tend to distribute the pressure uniformly when the flanges are tightened against the wheel. Compressible washers of blotting paper or rubber gaskets are satisfactory.

SIZES OF SPINDLES RECOMMENDED AS STANDARD FOR VARIOUS DIAMETERS AND THICKNESSES OF GRINDING WHEELS. NATIONAL MACHINE TOOL BUILDERS' COMMITTEE — APRIL 23-24, 1914.

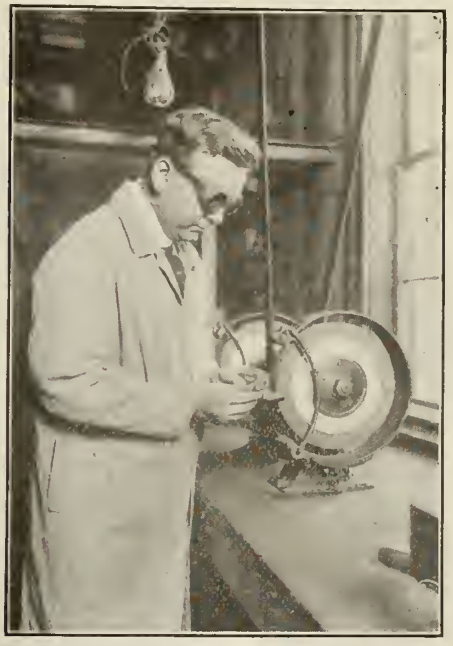
THE MOUNTING OF GRINDING WHEELS.

Relation between size of wheel and size of machine.—Caution must be taken not to use wheels larger or thicker than recommended or provided for by the grinding machine manufacturer. If it be desired to use larger or thicker wheels, the matter should be taken up with the machine manufacturer.

Relation between size of hole in the wheel and size of arbor or spindle.—The hole in the wheel and the spindle on which the wheel is used should be of such diameter that the wheel slides on the spindle easily, yet not loose enough to in any way cause the wheel to run out of true. If the hole of the wheel be small it can easily be scraped out if leaded; or worked out with an old file if not leaded. Such work, however, should only be done by careful workmen, since breakages are known to have resulted from improper reaming of holes. Insofar as possible, your committee recommends that, for future designs of floor and bench machines, you adopt uniform sizes for grinding wheel spindles in accordance with the table here given.

Relief of Flanges.—All flanges, either straight or safety shape, which are used on floor and bench machines, should be relieved. Flanges used on all other types of machines should be relieved wherever possible The extent of the relief should be such that a flat ring-bearing surface, which is approximately 1-16 of the diameter of the flanges in width, is left near the periphery of the flanges.

Cup and Cylinder Wheels.—The types of wheel chucks which inclose at least 3/4 of the wheel have proven satisfactory, so that if a cylinder wheel be used in such a chuck the mounting can be considered satisfactory. When cup wheels are mounted between flanges, both flanges should be of the same diameter and should be of such size that the inside flange has not less than 1/4 in., or more than 3/8 in. clearance between its periphery and the inside surface of the rim of the wheel. All cup wheels mounted



between flanges should be covered, as much as operating conditions will allow, with a protection hood. Cup and cylinder wheels which are mounted in a manner similar to those used on the Pratt & Whitney vertical surface machine should always be protected by a strong hood.

Clamp centers.—Care should be exercised in mounting wheels with clamp centers. If the hole in the wheel and the part of the center which goes into the hole is a tight fit, there is great danger of the wheel being broken when the bolts are tightened. If a wheel does not mount easily on clamp centers, the manufacturer of the wheel should be notified and the wheel put to one side until receiving his instructions.

Devices to Protect Operators.

Wherever the operation will permit, a well-designed, substantial protection-hood should be used. In such situations, a tapered wheel and flanges of a corresponding taper are not necessary. Where hoods cannot be used, tapered wheels in connection with flanges of a corresponding taper afford the next best means of providing safety. Care should be taken not to use flanges tapered less than the wheel is tapered. Tapered flanges should be of such diameter that as little as practical of the wheel should be allowed to project. In no case should the portion of the wheel extending beyond safety flanges be more than 4 inches.

The present type of hoods used on cylindrical machines, plain surface grinders, universal tool and drill grinders, are proving satisfactory; but if

BENCH TYPE GRINDING WHEEL STAND PROPERLY EQUIPPED WITH PROTECTION HOODS. NOTE GOGGLES ON OPERATOR.

larger and thicker wheels should be used some of the types of hoods now in use may prove to be unsatisfactory. If failure of a hood should occur under any conditions whatsoever, this committee will be very grateful for complete details regarding the case in question.

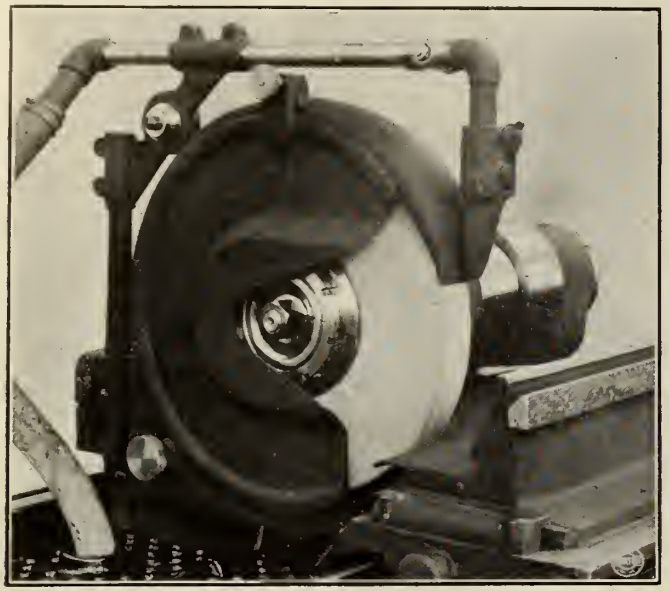
The statement is sometimes made that it has been found impracticable to use hoods or guards for a number of common grinding operations. It is the concensus of opinion of your committee that if a little time and care were spent on the design of a hood one could be installed which would provide the necessary amount of safety and yet not interfere with the operation in question.

General Suggestions.

It is good practice to have one man assigned to the care of grinding wheels and machines. He should examine every wheel before it is mounted, supervise the mounting of the wheel, and be held responsible for proper speeds being used. Care should be exercised in the storing of grinding wheels, making sure that the wheels are not damaged in any way. Wheels used for wet grinding should not be left partly submerged in water over night or else when starting in the morning the wheel will be found to be badly out of balance. If the grinding wheel vibrates badly it should be carefully trued. If vibration is found to be present after a wheel is trued, the wheel should be tested for balance and if found to be badly out of balance the fact should be reported to the wheel manufacturer. On floor and bench machines the work rest should be adjusted close to the grinding wheel to prevent small pieces

SHOWING HOW WHEEL SHOULD BE PROTECTED BY HOOD WHEN SNAGGING HEAVY CASTINGS WITH AID OF CHAIN HOIST.

SHOWING PROTECTION HOOD, LEATHER SPARK BRUSH, GLOVES, GOGGLES AND PROPER ADJUSTMENT OF REST.



from wedging and thus causing accident.

Grinding Machines.

Belts.—All belts within reach of the workmen should as far as possible be guarded on the intake side.

Revolving set screws, dogs, etc.—The design of machines should be such as to avoid as far as possible the use of set-screws and dogs. Where it is not possible to eliminate them, countersunk set-screws and properly guarded dogs should be used.

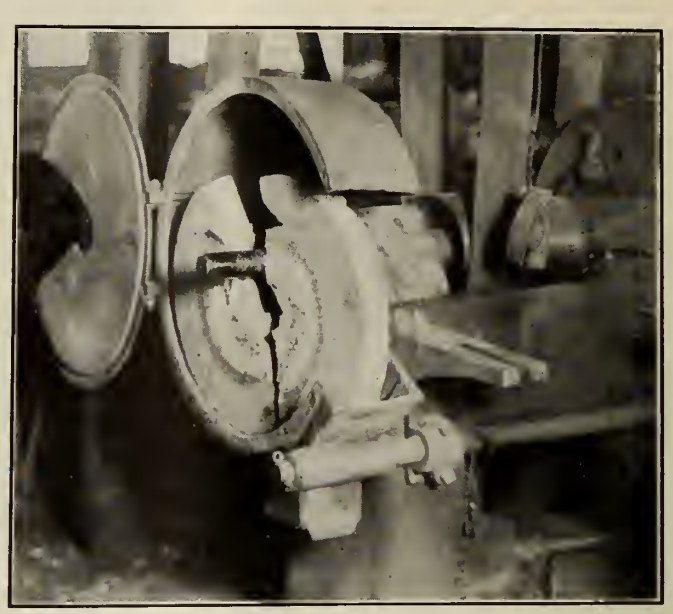
Gearing.—All gearing should be fully guarded.

HOOD ON NORTON CYLINDRICAL GRINDING MACHINE.

Chances for being pinched.—This should be taken care of in the design of the machine.

Means for avoiding cuts from grinding machines.—It is often possible to make use of swinging pans of guards which will come between the operator's hand and the grinding wheel, thus greatly reducing the chances of being cut by the wheel.

Dust Exhaust.



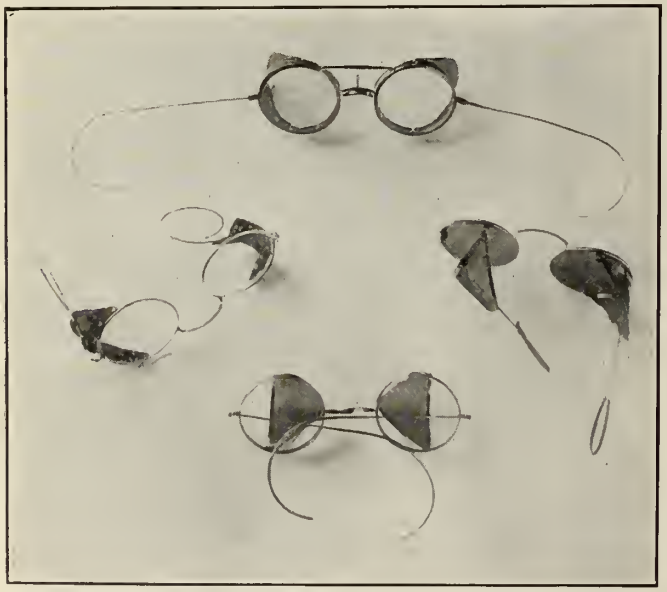
Existing State laws are stringent enough to take care of any quantity of dust generated by dry grinding or polishing. Positive means for disposing of the dust after it is collected should be provided.

Laws.—Federal, State and Foreign.

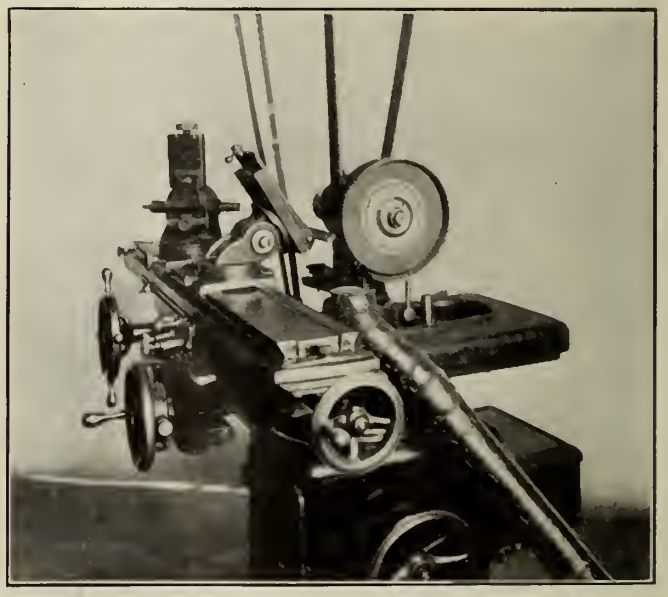
It is recommended that this Association uses its influence towards a uniformity in laws and that support be given to the Brommer Bill which is now before the U. S. Congress.

Relation to Accident Insurance Companies.

This Association should work toward a reduction in the rates of accident insurance by providing adequate guards to machine tools. It is recommended that the compensation laws be so interpreted and administered as to maintain a good understanding between employer and workmen.



EFFICIENT TYPE OF HOOD FOR FLOOR STAND.



Relation to Other Societies.

It is the recommendation of your Committee that hearty support be given to other national societies in their safety work

We understand that a central safety committee has been formed by some of

TYPES OF GOGGLES USED BY GRINDING WHEEL OPERATORS.

CAST STEEL PROTECTION HOOD ADAPTED TO TOOL AND CUTTER GRINDING MACHINE. HOOD IS ADJUSTABLE.

the other national societies among whom are the National Association of Manufacturers, and the National Founders' Association The plan is to eliminate duplication of effort as much as possible, besides obtaining the views of all parties directly interested. For instance, to the National Founders' Association would be assigned the task of specifying safeguards for foundry machines, and this phase of the safety question would therefore not be touched upon by the other associations.

We feel that the Machine Tool Builders' Association should be the one to handle the subject of safeguards for machine tools, and therefore suggest that the secretary be asked to correspond with the central safety committee regarding this matter.

ELECTRO-PLATING ZINC ALLOY DIE CASTINGS.

DIE castings that are to have a polished surface should be "cut down" with the usual buff wheels and tripoli composition, says a booklet issued by the National Lead Co., New York. The finishing should be done with white compositions of Vienna lime. After the parts have been polished, the excess of polishing material should be removed by the aid of benzine or gasoline, and they should be dried in maple sawdust. If the benzine or gasoline is dispensed with, hot alkaline solutions should be used for cleansing. The strong alkalies of caustic soda or potassium should never be used in cleansing zinc, as they have a reducing action upon the metal and produce oxides, thus destroying the polished surface. The solution should be maintained at a temperature of 160 to 180 degrees F. Soda ash may also be used for the purpose, one pound of this material and one-quarter ounce of cyanide of potassium being used per gallon of water.

The articles should remain in the cleansing bath for a few minutes, and then the excess polishing material brushed away, using painters' oval sash brush for the purpose; the rubber-set variety is the most economical. After cleansing, immerse in clean, cold water, and then into a cyanide dip. This dip should consist of 6 ounces of cyanide of potassium or sodium to each gallon of water, and should be used cold. After re-washing the articles in clean cold water they are ready for the plating bath.

Articles to be finished are cleansed in the same manner, if somewhat corroded due to the formation of oxide of zinc on the surface by contact with moisture. Immerse for a few seconds in a pickle consisting of one part of hydrochloric acid and four parts of water (this will dissolve the oxide); then rinse the die castings in cold water, immerse in the cleaning solution for a few seconds, re-wash in cold water and scratch-brush to bring up the color of the metal. Repeat the cleaning operations, using only the cleaning solution and the cyanide dip; the casting is now ready for plating. If the articles are to have a polished finish, the scratch-brushing may be dispensed with.

Copper-plating Die Castings.

The solution for copper-plating should have the following proportions:—

Water	1 gallon.
Cyanide of copper	3 ounces.
Carbonate of potash	1 ounce.
Cyanide of potassium or sodium	4 ounces.

To prepare the solution, the potash and copper should be dissolved in half the amount of hot water, the cyanide in the balance of lukewarm water; then mix thoroughly together. Use the solution at a temperature of 150 degrees F. and at 2 to 2½ volts pressure. Cast copper anodes give the best results, but the electrolytic variety may be used.

Brass-plating Die Castings.

Prepare a solution exactly the same as for the copper bath; then dissolve equal parts of cyanide of zinc and cyanide of potassium in warm water. An addition of 1 ounce of zinc carbonate and the same proportions of cyanide should be added to the copper bath per gallon; then add ½ ounce of sal ammoniac per gallon of solution. If the color should be too deep a yellow, a little more zinc should be added to the bath to obtain the required shade. This bath should be used at a temperature of 120 degrees F. and at 2 to 3 volts pressure. The cleansing of the articles should be done as previously stated.

Nickel-plating Die Castings.

Much trouble has been experienced in nickel-plating die castings with the ordinary solution, due to black streaks appearing in the deposit caused by local action of the ordinary solution upon the metal. The following formulae will give satisfactory results without the difficulties mentioned:

Nickel sulphate	10½ ounces.
Potassium citrate	7 ounces.
Ammonium chloride	10½ ounces.
Water	2½ gallons.

To prepare this bath, dissolve the nickel sulphate and ammonium chloride in half the amount of hot water prescribed; then dissolve the potassium citrate in the balance of the water and mix thoroughly. The voltage should be 2½ to 3 volts. This bath should always be kept neutral to avoid black streaks. For this purpose, pure caustic potash dissolved in water should be added to the bath so that the solution is neutral to the test of red or blue litmus paper.

The following bath is used extensively in plating articles made from zinc and gives excellent results:

Double nickel salts	8 ounces.
Chloride of sodium	1 ounce.
Magnesium sulphate	2 to 4 ounces.
Water	1 gallon.

To prepare the bath, dissolve the nickel salts in half of the water at a temperature of 180 degrees, and dissolve the other salts in the balance of cold water; then mix thoroughly together. Use this solution cold, with anodes of cast nickel. The voltage should be 2½ to 3½ volts. The articles to be nickel-plated may be plated direct or be lightly coated in the copper or brass baths prior to nickel-plating. The time of immersion in either of the nickel baths should be according to the thickness of the deposit required, although thirty minutes gives a fairly good deposit in either case.

Silver-plating Die Castings.

Cyanide of silver	3 ounces.
Cyanide of potassium	4 ounces.
Water	1 gallon.

Use anodes of pure silver at about 1 volt pressure. Die castings for silver-plating should be previously copper-plated for a short time, then amalgamated in a mercury dip consisting of the following proportions:

Water	1 gallon.
Oxide of mercury	½ ounce.
Cyanide of potassium	6 ounces.

After copper-plating and washing in water, the articles are immersed in the dip for a second or two, or until uniformly coated with mercury. They should then be re-washed and immersed in the silver bath. The articles may also be nickel-plated in one or the other of the nickel baths, and then quickly coated in the silver striking solution, after which they should be directly immersed in the silver bath without rinsing.

The silver strike should be as follows:

Cyanide of silver	½ ounce.
Cyanide of potassium	6 ounces.
Water	1 gallon.

Use silver anodes with 3 to 4 volts pressure. The nickel surface must be immediately coated over for successful silver deposits.

U.S. Anthracite Coal Production.—All previous records of anthracite coal production were broken in 1913 when the output was 81,718,680 long tons, according to recent figures by the Geological Survey. This exceeded the highest previous output by nearly 1,000,000 tons. Last year's production was valued at $195,-181,127, compared with 75,322,855 tons valued at $177,622,626 for 1912. The average working time for men established a record in the anthracite region. The average was 257 days, the nearest approach being in 1911, when an average of 246 working days was recorded.

Some Recent Improvements in Case-Hardening Practice*

By H. L. Heathcote, B.Sc.

The subject matter of this article treats of what has been done relative to case-hardening in the works of the Rudge-Whitworth Co., Coventry, England, and indicates at the same time how the problem presents itself and the manner of seeking a solution.

EVEN to the casual visitor and the superficial observer it must he obvious that, generally speaking, the machine shop is ages in advance of the hardening shop. In the machine shop are to be found highly differentiated machine tools, each the last word in scientific design and construction, embodying the hest engineering knowledge and skill of many nations. The tools, as often as not of high-speed steel, and the grinding wheels, are both the outcome of special research in different hranches of chemical industry. The men are well trained and well paid, and the organization of the shop is another testimony of the stage of development arrived at. Not only are its tools, its plant, and its employees of superior grade, but its output is suhjected to strict viewing by skilled men using instruments of precision. Needless to say this reacts on the shop as a whole, and makes for rapid rectification of faults and a high standard in every part.

Compare this state of affairs with that prevailing in a typical hardening shop some years ago. Instead of a well-lit, well-ventilated, and comparatively clean shop, we find a dark, grimy shed, something like a miniature gasworks, unhearahly hot and reeking with cremated ox remains and fishy oil. Here a gang of men pound a dusty black mixture into iron pots round some of the articles that have just come from the machine shop or automatic shop; there another gang, equally grimy, hut more oily, wield tools that Tuhal Cain may have used—their plant, crude furnaces, uncontrolled save by the unaided eye.

Not only were their tools and plant crude; their materials and labor were crude too. The labor employed was anything hut skilled, and the case-hardening composition savored more of quack medicines than British pharmacopoeia preparations. What little viewing was done threw little or no light on the causes of distortion, softness, or cracks, yet this was the shop to whose tender mercies much of the machine shop output was handed over, there to he made or marred.

This then was the prohlem; to raise this outcast, isolated, and forlorn process of chemical industry to the dignity and standing of machine-shop practice; to investigate the materials it employs and throw light on their mode of action; to provide simple means of controlling the furnaces and of measuring the resultant hardness and resistance to shock; in a word, to do for the hardening shop what science and industry had already done for the machine shop.

An Improved Pyrometer.

We started out at the furnace end and decided to install pyrometers, but were soon met by the fact that an efficient pyrometric outfit for a battery of thirteen muffles is an expensive thing, especially for an industry where competition is so keen and the work so varied. Moreover, it threatened to cost something to keep it in working order; and on second thoughts it seemed very questionahle whether thermo-electric and resistance pyrometers would be suitable for a system starting with a hot furnace full of cold work, or for ascertaining the temperature of an isolated article.

The Fery instruments were then unknown, so the author started investigations at the Rudge-Whitworth Research Laboratory with the object of ascertaining the temperature of red-hot hodies from their color. On examining the spectrum of a red-hot piece of steel it is found to elongate at both the red and violet ends and to increase in intensity all along as the temperature rises. This suggested the possibility of ascertaining the temperature of red-hot hodies hy means of a direct vision spectroscope provided with a graduated scale (also used by Hempel), hut it soon became evident that the difficulty of seeing just where the green ended precluded the possihility of anything approaching accuracy; and the extension of the red end was not sufficient for the purpose. Attempts were made, by screening off the brighter parts of the spectrum, to render the green or blue end more distinct, but it was found that the end point varied considerahly with the same ohserver, and that many eyes cannot focus a sharp image on the retina when pure hlue or green rays are transmitted. A long series of experiments was carried out to try and produce solutions and mixtures of solutions or emulsions, the absorption of which closely followed, hoth in range and intensity, the radiation curves for steel at different temperatures.

Permanence of Selected Solutions

Having found a range of solutions capable of ahsorbing the rays emitted by red-hot steel at various temperatures, and at the same time suited to the peculiarities and conditions of the eye, the author proceeded to investigate the permanence of the various mixtures in the dark and under the action of light; also their behaviour in contact with retaining vessels, such as glass and india-ruhher. Some were found to decompose on keeping, some changed in color, some precipitated; others were found to be soluhle in glass. Some were found to withstand the action of light, in contact with glass and india-ruhher, without any apparent change.

Calibration of Solutions.

The chosen solutions were calihrated hy viewing the end of a steel cylinder heated in an electric furnace and taking the temperature of the steel at the moment is ceased to appear visibly red by means of a platinum-rhodium thermo-couple pushed close up to the back of the cylinder end. To remove any possible error due to the temperature of the junction heing perhaps not exactly the same as that of the visible end of the cylinder, the calihration of the couple was effected by melting a number of pure substances of known melting-point on a minute ledge on the flat end. For temperatures above the scope of this arrangement the thermo-couple was dispensed with, and the melting of, for instance, nickel and platinum ohserved through the cells.

Design of Instrument.

In one of its forms the instrument has a stereoscope-like eye-shield to guard the eyes from extraneous light. Instead of two lenses there are two pairs of dye solutions well protected hy caps, which also serve to keep the light out. This form is suitable when some particular temperature is required. For instance, the case-hardening temperature is now controlled hy employing an instrument like this, with one pair of cells containing dye solution adjusted to 900° C. and the other to 925° C. If the pots are visihle through the 900° pair and invisihle through the 925° pair the temperature is considered correct. There is no need to remove the eyes while the pairs are changed; this is done by sliding the aluminium carrier to one side or the other.

For re-heating work, and for hardening tools, a single pair is all that is necessary. The hardening temperature is attained as soon as the work appears just visibly red. For double re-heating, two pairs are, of course, necessary; e.g., 760° and 880° C. The cells can be interchanged and are readily detachable, so

*From a paper read before the Iron and Steel Institute.

that one instrument can be used to ascertain any temperature, provided the object be visibly red hot. The actual container is a glass tube less than 1 inch long, with accurately fitting glass ends held together on rubber rings by two telescoping brass tubes. In form the cell is much like a short polarimeter tube. The caps on the aluminium slides are provided with springs to prevent the cells falling out.

In another form the instrument is adjustable, and is either monocular or binocular. In these, the dye solution is contained in expansible cells, and a range of absorptive powers obtained by altering the length of the column looked through. The first of this form was made with two thick glass ends and a length of inner tube from a bicycle tire. On squeezing the glass ends together the rubber sides bulge outwards. The actual container is inclosed in this tube, which is provided at one end with an eye-piece shaped to fit the eye and nose, and at the other with a screw end which lengthens the cell until the added part is sufficient to just absorb the light. The temperature is then given by the scale engraved on the tube, much like a micrometer is read. In this form the instrument is 3 inches long by 1½ inch diameter, and is very handy.

Determining Temperatures.

This method of determining temperatures is a zero method, and is, therefore, caeteris paribus, more accurate than one involving a comparison of colors. Furthermore, the critical point occurs when the eye is shaded from extraneous light, that is when the pupil is dilated and the retina is in its most sensitive condition. In judging temperatures by the unaided eye, errors are caused by:

1.—Extraneous light falling on the eye.

2.—The difficulty of remembering close shades of color.

3.—Errors of judgment in comparing the image of the color observed with a series of mental images of colors previously seen.

All these chances of error are eliminated by an instrument of this kind. No extraneous light falls on the eyes and no recollection is required; the hardener has simply to look through, wait about half a minute until his eyes have become accustomed to the darkness, and then see whether the object is visible as a dark red patch or invisible. Hardeners seem to prefer to use their eyes for telling the temperature, and these instruments provide pyrometric equivalents for limit gauges and screw micrometers, and at the same time screen the eyes from the glare and heat of the furnace.

The readings are admittedly dependent on the sensitiveness of the eye; if this vary from person to person, the temperature readings will vary accordingly, being lower the more sensitive the eye. As already stated, these variations do not affect the accuracy momentously, and from actual experiments carried out with this and with another optical pyrometer working under very similar conditions, the author feels compelled to believe that the variation in sensitiveness, under the actual working conditions of these instruments, is not nearly so great as might be expected. If the object be a large one, it is advisable to interpose a perforated screen between it and the instrument.

One way to make an observation is to adjust the instrument to a lower temperature than that expected, and then, by sliding darker cells into position or by unscrewing (if of the adjustable form), darken the image until it just ceases to appear colored. The temperatures engraved on the cell or the body of the instrument will then indicate the temperature of the hot body, provided that the conditions of the test are as nearly "black body" as those obtaining when the calibration was effected. Fortunately red-hot iron and steel surfaces have an emissivity of nearly unity, so the error is not large, and can generally be neglected for industrial purposes. Furthermore, any error from this source will not prevent the instrument giving comparative readings under similar conditions, which is all that is necessary in repetition work.

These instruments have been applied with satisfactory results to the heat treatment of steel, carburising, re-heating, annealing, and hardening tools of all kinds. One has outlasted two thermo-electric pyrometers, and it is the author's opinion that a pyrometer which indicates its own temperature may convey some idea of the temperature of the work, but will never be the hardener's friend to the same extent as one of the forms of optical pyrometer which can be focused on the article itself.

Case-Hardening Compositions.

Having provided a simple and effective device for ascertaining the temperature of red-hot bodies, the author set about investigating case-hardening compositions—their nature, mode of action, and effect. Obviously, for carburizing to occur, the heat must first penetrate to the steel and raise it to the gamma condition; it must liberate and maintain a supply of the carburizing ingredients; the peripheral layers of the steel must combine with (or dissolve) these ingredients; and the carbide must diffuse from the periphery inwards.

The composition of case-hardening materials varies very widely. The following table shows the range of variation in seventeen commercial compositions tested:

Table I.

	Per Cent.
Moisture	2.68 to 26.17

When these experiments were commenced the mixture of barium carbonate, 40 per cent., and charcoal, 60 per cent., suggested by Guillet, had not been put forward, and it was usual to use case-hardening compositions once only or perhaps twice. Another drawback experienced in commercial operation, for instance, with pots 10 inches high by 10 inches diameter, was the difference in the depth of penetration near the middle and the outside of the pot. Some compositions showed as much as 150° C. difference in temperature between the inside and the outside. The author accordingly set out to improve:

1.—Permanence, and to obviate loss of activity and consequent wastefulness.

2.—Permeability to heat, and to obviate unequal heating and casing.

Permanence

The supposition that this loss of carburizing power was due to loss of nitrogenous constituents was confirmed by the early experiments. Spent hardening mixture may contain 12 per cent. organic carbon (total carbon, less carbon in carbonates), and yet, under similar conditions, have far less carburizing power than fresh material containing less carbon. Such spent mixture gives indication of only traces of nitrogen. Two similar compositions, one having a much greater carburizing power than the other, gave the following results by the Kjeldahl test:

Composition.	Nitrogen per cent.
Good	2.72, 2.60
Bad	0.51, 0.47

Indirect evidence of the influence of gases (possibly nitrogenous) evolved from the mixture shows that it is possible to carry off the carburizing gases by a current of coal-gas in much the same way that oil is removed by steam distillation; on the other hand, heating in gases which contain no nitrogen compounds may carburize mild steel.

The second and concluding portion of this article will appear in our next week's issue.

Direct Current Electric Drive for Overhead Cranes

By R. H. McLain *

The author discusses the design of motor best suited for each of the more common crane service requirements. Methods of speed control and braking as commonly adopted are dealt with at considerable length, while suggestion is made of suitable motors and brakes for the trolley and bridge motions. Protective devices also come under observation.

DURING recent years many improvements have been made in the electrification of cranes with direct current apparatus, both in regard to the manufacture and the design of the electrical material and in the proper selection of equipment to meet the specific requirements.

The service conditions for the various classes of work have been shaped into very definite channels. In some cases a motor is required which will hoist tremendous loads for five or ten minutes at a time and then lie idle for long periods. In other cases, a motor is required to occasionally hoist a very heavy load for a short time and, in addition, is required to keep busy most of the time hoisting moderate loads. Some industries require a motor to operate in a very hot location, and, therefore, demand special noncombustible insulation.

The controller requirements are classified very much along the same lines; but many new possibilities in controllers have recently been worked out. Dynamic braking for lowering is becoming more popular in order to save the expense, wear and adjustment on mechanical brakes and to gain more refined speed control. The "Safety First" movement has invaded cranes and brought about a demand for absolute protection for the operator; this involves the protection of the motor and equipment as well as of the load on the hook.

Power House Cranes.

About the simplest and cheapest class of crane is the one used for setting up machinery in a power house. Once the heavy machinery is set in place the work of the crane is done, except for a few repairs or alterations which must be made at rare intervals. Such a crane may lie idle for weeks. A low hook speed is required and, therefore, no speed control refinements are necessary. All the control and protective apparatus should be made as simple as possible, so that it will be easy for an untrained operator to manipulate, and so that it will not get out of adjustment when not in use. The apparatus should be made as inexpensive and small as is consistent with the extremely heavy load which must be handled when the power house is first built or when additions to the power house are made. While the apparatus should be strong, no especial expense need be incurred to make it stand wear.

Machine Shop Cranes.

The class of crane which serves machine shops comes next above the power house crane in point of severity of service. They have at rare intervals very heavy loads to hoist, but are on duty at all times, serving the machines, bringing up raw material and holding parts in place on the assembly floor and so on. High speed in these cranes is not so important merely for the purpose of moving material rapidly, but is frequently important when the crane occupies such a place that its slowness would keep high-priced mechanics idle while waiting for it. Such a crane requires a series wound motor which can stand extreme overloads, can speed up on light loads, will wear well, and which is light and accessible for repairs. Interpoles come in well on such a motor, because of the overloads and high speeds; split motor frames and large convenient openings to the brushes are well worth while so as to enable repairs being made easily and quickly. Such a motor must be built both for strength and wearing qualities.

A good easily operated controller of the manual type with no live parts exposed to the operator is best adapted to this class of work. Ordinarily there is not enough work done in lowering heavy loads to make it necessary to use dynamic braking; but, if it be used, the controller, and especially the motor, must give high speeds when lowering so as to speed up the work. To obtain this high speed the controller must have a large number of points, and the resistance steps must be just as carefully laid out as is the resistance in the field circuit of an adjustable speed, shunt wound motor, because the crane motor is connected very much like a shunt wound motor or generator when lowering dynamically.

The motor had best be of the interpole type, although a well designed non-interpole motor can lower at 50 to 75 per cent. above its hoisting speed. If correctly proportioned, interpoles are used and, if the brushes be securely and accurately held at the "neutral" position, the motor can easily lower at twice the hoisting speed. An improperly constructed motor either sparks at the commutator or is unstable in speed. In the majority of cases no especial refinements in speed control are needed and ordinary rheostatic control is sufficient; but where very exact work is to be done, such, for example, as requires a uniform speed less than 15 per cent. of full load hoisting speed, it is unwise to obtain this creeping speed by connecting resistance in shunt with the motor as well as in series with it on the first point of the controller.

Such a connection definitely limits the motor speed to any desired low speed regardless of the load on the motor and makes a most desirable condition for such cranes as are required to do delicate work with heavy loads. Foundry cranes whose hook speed is above twenty feet per minute, frequently use this connection so as to take care of pattern drawing. Hand-operated controllers are good enough for this class of work unless careless operators are employed or the motor capacity is greater than 50 to 75 horse-power. Automatic current limit controllers prevent the abuse of the motors and are better able to stand up to service requirements on large motors than hand-operated controllers.

On this class of cranes, the solenoid brake is usually series wound instead of shunt wound so as to get quick action, to reduce the number of trolley wires, and because a series wound coil uses heavier and, therefore, more substantial wire than a shunt wound coil. If a mechanical load brake is used, the solenoid brake need have only sufficient retarding torque to bring the armature smoothly to rest, because the braking action for holding and lowering the load is all supplied by the load brake. About 50 per cent. or less of the normal rated motor torque is all the solenoid brake need exert on the shaft of the motor. More torque would produce too violent a stop.

If dynamic braking be used, no mechanical load brake is necessary, and, therefore, the solenoid brake must not only retard the armature, but must also retard and hold the load. Owing to the fact that the friction losses in the crane machinery help to prevent the load from falling, the brake need only have about 70 per cent. of the torque which is required on the motor when it is hoisting its maximum load. The exact value required depends on the amount of friction loss in the crane hoist.

Powerful action on the part of the brake does not necessarily produce

*Power and Mining Engineering Department, General Electric Co.

violent stopping, because ordinarily the dynamic braking really stops the motor and the solenoid brake only has to hold the load, although in case of dynamic braking should fail to operate, the solenoid brake would have to stop the load as well as hold it. Violent action does take place in the hoisting direction, but this is not objectionable, because the weight of the load helps so much with stopping that the violent action is not felt. Still, if a very powerful brake be used, it will be objectionable in this respect at times, and, for this reason, too much retarding torque should not be demanded of a solenoid brake. It is far better to have a brake just powerful enough, but with ample wearing surfaces so as to be reliable.

Yard Cranes

The class of crane, as regards greater severity of service, next to the machine shop crane, is the shipping yard crane around steel mills. Here speed is everything. Large amounts of raw material must be moved rapidly and on schedule time. The motors and controllers are kept so busy that they should not be worked anywhere near their extreme limits else their life will be impaired. Dynamic braking should be used for lowering, and, on motors above 40 to 50 horse-power, automatic control should be employed. In fact, for dynamic braking it is far more important to have automatic control than for reversible work because it is easier for a careless operator to damage the motor. In very many places it is profitable to put automatic control on all motors so that the crane can make the greatest speed with the least abuse to the motors, and with the least care and skill on the part of the operators.

Special cranes for handling sand, clay, etc., in buckets or lifting magnet cranes work the motor so hard and so regularly, both when hoisting and when lowering, that the temperature rise is the limiting feature. If these motors are not exposed to the weather it will be economical to use open type motors provided a smaller motor could be used without its being too much overloaded at the commutator. Owing to the fact that the maximum loads are easily determined, the motors can be selected with certainty. Dynamic braking for lowering should be used and, since the loads do not vary much from a fixed condition, the controllers and resistances should be designed for the particular condition so as to get the highest speed possible at all times without abusing the motors. Automatic control should be used on motors above 40 to 50 horse-power.

Soaking Pit Cranes.

About the severest crane on electrical apparatus is the crane in steel mills which not only works hard most of the time, but works in a high temperature. Soaking pit cranes and some charging cranes come in this class. Here noncombustible insulation should be used in the motor and, wherever possible, on the wiring of the crane. Accessibility of all electrical parts is of vital importance. Automatic control should be used in all instances unless space or temperature forbid. In come cases there is not sufficient room for contactor panels, and a small manual controller must be crowded in, although it may have to be repaired every few days. While temperature would have no worse effect on a contactor panel with fire-proof wiring than on a hand-operated controller, yet the loss is greater in amount when the contactors are lost, and, therefore, it would in extreme cases be better to use hand-controllers.

Trolley and Bridge Motion.

Only the hoist motion has been discussed above. The trolley and bridge motion are simpler and usually require smaller motors. The motors should be series wound and similar in general characteristics to the hoist motor which is chosen for the crane. The motor should have as steep a series characteristic as possible so that, after exerting its full torque for starting or pulling over bad places in the track, it will rise to a relatively high speed and gain all the time possible. Simple reversing controllers are used for these motors. In most cases hand controllers are employed, but on high-speed cranes automatic controllers are used. No dynamic braking is needed, but sometimes the motors are stopped by reversing them while they are running. If this is to be done, ample resistance should be used on the first point of the controller to limit the current under this condition and thereby permit of gradual stopping.

This method of stopping is not dependable, because it would be ineffective should power fail. Where the trolleys are used for pulling or shoving cars it is advisable to use automatic control to prevent the operator from turning too much power on the motor when it is overloaded. Where automatic control is used for such purposes there should be at least two hand-control points on the master controller so that the action of the motors will not be too jerky. Where no such work is required, the trolley motor need have only one point hand control, but the bridge motor should have two points hand control, because the bridge track is usually uneven, and consequently if only one point hand control were used it would have to provide sufficient power for starting on an up-grade, and it would cause a jerk where the track is down-grade. Ideal conditions are obtained by having two hand points, the first to admit a small current for starting down-grade and the second to provide more current for up-grade.

On ladle cranes, where the trolley motor is used for pouring hot metal it is often advantageous to have one positive creeping speed point on the controller. This point can be obtained by connecting resistance in shunt with the motor as well as in series with it; but no resistance should be connected in shunt with the armature, because there would result a dynamic braking action by the motor if the master controller be thrown to this point after the motor has been running at high speed, and this action would cause the ladle to swing. Solenoid brakes are sometimes used on the trolley motor for stopping, but for satisfactory operation their retarding torque must just fit the needs of the case. Usually 10 to 30 per cent. of the rated motor torque is all that is required of the brake. Too much torque would stop the trolley so quickly as to make the hook swing and jerk. Foot operated brakes are almost universally used for bridge motion because of the gradual stopping which can be obtained most advantageously in this way.

Safety for the Individual.

Crane protective devices have been standardized. On account of the expense and annoyance of replacing fuses they have been practically discarded on cranes; and overload relays in connection with contactor type circuit breakers are used instead. Short circuits and grounds on the crane are relieved by having one single pole breaker and one overload relay in each side of the line. Damaging overloads on the motors are prevented by having one overload relay in the circuit of each motor on the crane. Single-pole knife switches for each motor are frequently used so as to provide a convenient means of tracing out troubles in the wiring. A main line double-pole knife switch is used for disconnecting the crane entirely from the line, and, in order to insure that this switch remains open while repairmen, oilers and painters are on the crane, a staple for locking the switch open is used. Any man who goes on the crane can protect himself by locking the switch with his own padlock. Space for several such padlocks is provided so that each individual can insure his own protection with his own padlock, and thus prevent accidents due to carelessness or misunderstanding on the part of other people.

Safety for the Load.

Safety for the load is obtained by an emergency switch which is installed within easy reach of the operator. The emergency switch should be convenient to operate and so constructed that an operator can open it quickly without exposing himself to live parts or electric arcs. A back-of-board-switch operated

by a front-of-board-knob is best for this purpose, and the switch should be double-pole so as to open both lines. The function of this emergency switch is to shut off all power from the crane and allow the solenoid to set. On dynamic brake controllers it gives extra safety to have the motor hold back in an emergency such as occurs when the solenoid brake fails to hold. Hand-operated dynamic braking controllers always have the motor connected to brake dynamically on the lowering side and at the "off" position, but not on the hoisting side. If there is a case where a great degree of safety is required a normally closed contactor should be used which would establish dynamic braking connections when power fails even if the controller handle is on the hoisting side. Contactor automatic hoist controllers which give dynamic braking should always be equipped with the normally closed contactor. Hot metal cranes and many others are equipped with more than one solenoid brake so as to get additional protection for emergencies.

Hoisting Limit Switches.

Unfortunately there is one problem on the crane hoist which has not been solved to the satisfaction of all users. This is the limit switch for preventing over-travel in a hoisting direction. It is, of course, disastrous to hoist too high, as the ropes may be broken and the hook with its load dropped. In many places it is necessary to hoist very near the limit so as to clear obstructions over which the load is to be carried. Therefore, the operator must use great care. Two types of limit switches are used, but each is objectionable.

The first is a limit switch which shuts off power and sets the brakes when the hook is raised too high. This provides no means of getting power to the motor for lowering the hook and thus penalizes the operator for his carelessness by making it necessary for him to go to considerable trouble to get the hook down. The trouble with this type of limit switch is that much time is wasted every time it is tripped. Incidentally, some one in anger is liable to do something which will prevent the switch from working as designed and thereby defeat its whole usefulness.

The second type of limit switch is one which not only cuts off power when the hook is hoisted too high, but also provides a return circuit so that the operator can return the hook simply by reversing his controller. Such a limit switch will function many times without the operator even knowing it, and for this reason is liable to wear out quickly or lose its proper adjustment. The result is likely to be an accident, because the operator is trained to use the switch and thinks nothing of hoisting too high.

It seems that the only way out of the difficulty is to use the second type of switch, see that it is most substantial in construction and, above all, to inspect its condition and its operation at frequent and regular intervals. The very best switch which can be built should not be left unnoticed to do its work. On one point regarding these limit switches there seems to be a consensus of opinion —that the switch should open the main line power circuit close to the motor and not depend on some control circuit to open a circuit breaker in the operator's cage.—G. E. Review.

PORTABLE ELECTRIC TOOLS.

In a paper read recently before the Ipswich Engineering Society, the author, Mr. Andrew Stewart, said that the only serious rival of the portable electric tool was that of the pneumatic. Until the arrival of the electric tool the only way of getting power in small compass into awkward places was by means of compressed air, and its convenience, in spite of its inefficiency, created a large demand.

Apart from pipe-line losses, the distribution of power by compressed air is inherently uneconomical; and Mr. Stewart claims that an electric drill will do for an expenditure of one horse-power what will require from four to five horse-power delivered to the air compressor in the case of the pneumatic drill. This is taking the compressed air system at its best. "No one," says the author, "has ever had the moral courage to describe the nadir of compressed air inefficiency."

For a decade compressed air held the field in mining work, but with the development of the flame-proof motor electricity began rapidly to oust it. This change led engineers who were using compressed air for other industrial purposes to question its economy. Thus arose the demand for the electric tool; and the first attempts were frequently made "more from the electrical than the mechanical standpoint," with the result that the electric tool was not always fit for its work. In a number of cases small fan motors were used, merely being put in a case which contained the requisite gearing—a striking example of the inherent laziness of human nature. In the end the longest way round proved the shortest way home.

Designers eventually set to work to produce a machine large enough and strong enough to meet the heavy conditions to which it was generally subjected. There was an intermediate stage at which various safety devices, such as special fuses, slipping clutches, and overload alarms, were installed in order to prevent the electrical part of the tool from being overworked. Some such devices are still in use, chiefly on tools of German manufacture, since—according to Mr. Stewart—our Teutonic friends are inclined towards building an inherently weak machine with more or less adequate safeguards. The soundest line of progress, however, appears to be towards the self-sturdy tool.

Technical Problems Involved.

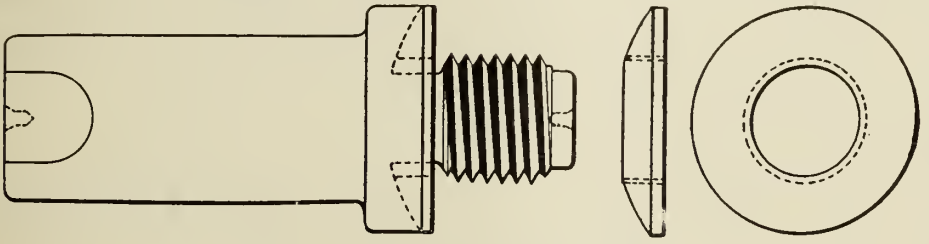
The two main technical problems involved are those of insulation and ventilation. Textile and other ordinary insulating materials have limits of temperature rise which are too low for practical purposes unless the ventilation is very good. The author spoke very hopefully of the use of a metallic oxide on the wire itself. "While such salts," he says, "have, comparatively speaking, poor insulating properties, they are in some cases as indestructible as the wire itself." With regard to cooling the motor, the plan of using forced ventilation (introduced by Mr. Duntley) is now in general use.

A diagram accompanying the paper indicated the great improvement which had been made in the efficiency of portable electric tools. Coincident with this improvement there had been a great advance in reliability, but it remains true that the results obtained from an electric tool depend to some extent on the user. The author remarked that the average workman is none too sympathetic towards labor-saving tools of any kind; therefore, a large factor of safety has to be allowed.

Another human touch in the tool business is that the maker has to think of appearances. "An engineer," said Mr. Stewart, "frequently chooses a machine for the same reason as many another man would choose a wife, not so much in the hope of deriving economic advantage from the object of his choice, but chiefly because he likes the look of it." To which we may add that beauty of design is, unlike female loveliness, more than skin deep.

Earning and Collecting.—It has been stated that the reason why so many capable men—those who have done things for the uplift of humanity and the advance of civilization—are so shockingly poor is because they have been so busy earning as not to have had opportunity to collect. On the other hand, there are all too many examples in evidence of those who are so busy collecting as never to have earned. It may be said, however, without fear of contradiction, that the man who does not earn more than he is paid does not lead a really useful life.

PRODUCTION METHODS AND DEVICES



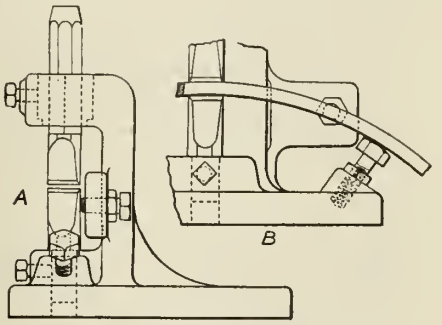
A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

NUT ARBOR FOR ACCURATE WORK.

IN a western plant building large numbers of hoisting and contractors' engines considerable trouble was experienced with the fitting of piston rods and cross-heads. These often bound when the nuts were tightened up, and quite a number of rods broke in service in the threaded part. The thread was a special one of ten to the inch, roughed out on a three-inch turret lathe and finished on an engine lathe.

The trouble was found to be with the lock nuts not being faced square with the thread, which tended to buckle the rod when tightened up against the cross-head. The trouble was completely overcome by making a set of nut arbors, shown in the cut. This arbor is similar to the ordinary one, except that the nut backs up against a loose washer, which is fitted to a spherical seat. As the nut tightens up, the face of the washer adapts itself to the back face of the nut, which, of course, is thus set according to the thread.

Not having the best facilities for making these arbors, the method adopted may be interesting. The arbor was finished all over as accurately as possible



NUT ARBOR FOR ACCURATE WORK.

in the lathe, and the whole hardened, except the back end. After lapping the thread and the seat for the washer, the back end was cut off, the arbor was screwed into a nut bored and threaded in the lathe to fit snugly, and, while being held in this way, a new back centre was carefully drilled and reamed. The local hardening of this centre completed the tool, which has been in use a long time and has given little trouble.

SIMPLE PISTON RING SPLITTING DEVICE.

The device shown in the accompanying illustration, while simply an experiment in the first place, proved so satisfactory in its work that it was finally adopted as a means of splitting all the smaller-sized piston rings.

As will be seen, it consists simply of two chisels so adjustable that they can be twisted to any angle and directly in line with each other. The shank of the lower one is turned down to a shoulder to fit a hole in the base of the body casting, where it is fastened by means of a set screw. The upper chisel is planed square in the centre to a shoulder at each end of the square part for the pur-

SIMPLE PISTON RING SPLITTING DEVICE.

pose of limiting its motion. This square is a sliding fit in a split steel collar, which is fastened in the top part of the fixture also by means of a set screw. A spring was first used to keep the top chisel up off the ring, but this seemed to cause a number of them to break in the wrong place. Screws are provided for adjusting the ring to the proper angle as well as for centering it.

The ring is placed in position; the top chisel is struck a smart tap, and after the two cuts have been made, the piece can be very easily broken out. This, no doubt, will seem to most mechanics a rough way of fitting pistons, but tests after the engines have been run off have shown these pistons to be fully as steam tight as others of the same size and with spring laboriously fitted by hand. It has been suggested that the rough surfaces of the ends tend to retain grease and other material which assists to prevent steam leakage.

It has been found that the tools can be so ground as to leave very little burr on the ends of the ring, and as the work is entirely done at little extra cost by the man who assembles the pistons, a considerable saving is accomplished.

SOLDERED JOINT QUERY.

By J. N. Ellethorn.

IN a recent issue of Canadian Machinery a reader wished to know why soldered joints will not prove satisfactory on steam coil joints. Solder, commonly known as tinsmith's solder, is made from equal quantities by weight of block tin and lead. Again, plumber's solder, which is used to make wiped joints has a larger quantity of lead than tin—usually about three of lead to two of tin by weight.

Steam at 100 pounds gauge pressure has a temperature of 327.625 degrees Fah. Tin melts at a temperature of 444 degs., lead at 614 degs.; half and half melts at 466 degs., and two to one at 475 degs., Fah. In view of the foregoing, it requires no great knowledge to understand that with steam at a high temperature passing through split pipes with soldered breaks, the solder will become very soft and weak. The pressure will soon force the solder apart as the pipe expands at the break, for as the solder becomes heated it looses its power to hold together the two sides of the split.

Even on low pressure steam-pipes a soldered joint is not to be recommended as the expansion of the solder and the iron pipe is altogether different. For example: the linear co-efficient of expansion for iron for each degree increase in temperature is .00000686, for steel pipe .00000599, and for tin .00001.410. Positively no soft soldered joint should be used on a steam pipe. For hot or cold water or any cold gas pipes it is all right if the pressures or temperature changes be not too great, because the tensile strength of solder is away below that of iron.

ELECTRICAL FIRES.

By J. E. Noble.

In most cases the chief engineer in large office buildings and factories has charge of the electric wiring for power and light. In hundreds of cases where fires occur, the blame is wrongly placed on such wires, although on the other hand it is a settled fact that many fires are caused by wrong placing or misbehavior of conductors. When proved cases of such fires occur they should be brought to the notice of all chief engineers. The following are a few that have been reported in electro craft from time to time, and although greatly condensed, I think they contain all the in-

formation necessary to make them of value to engineers in charge.

(1)—A gas fixture had been removed from a corridor on the upper floor and the wires left lying against a gas pipe. The insulation becoming old, the bare wire came into contact with the pipe, and there being a ground already on the service, an arc was formed. A small hole was burned in the pipe and the gas ignited.

(2)—A 500-volt motor was installed in a small room in a grain elevator. Dust was allowed to accumulate and was ignited by sparks from the brushes. A dust explosion followed.

(3)—Several distribution feeders to lights were run in paper conduits. Some of these conduits were in a channelway adjoining a metal lined air shaft. In fastening the metal lining in place. the nails were driven into the channelway and through the paper conduits containing rubber covered wires. The vibration of the building caused the nails to wear away the insulation of the wires. The arc thus formed set fire to the insulation, to the paper conduits leading to the air shaft, and finally appeared in the attic of the building. Tests made subsequently showed that a 50-ampere fuse in the feeder wires would not blow before a fire was started in the channel-way.

(4)—Cables in a tunnel leading from a large generating station were bunched closely together instead of being properly separated. A short circuit occurred on the system and produced such a heavy rush of current in the cables of the tunnel that their insulation melted away, exposing the bare copper. A very vicious arc was formed, and the insulation caught fire, which was in turn communicated to the power house.

(5)—A fire took place in a dwelling where unenclosed plug fuses were placed in the attic. A short circuit occurred at a fixture which blew the fuses, set fire to some wearing apparel and then to the building.

(6)—Old-style insulating joints for combination gas and electric light fixtures allowed gas to escape, which was ignited by small sparks between a grounded wire system and the fixture. The fire was thought to be extinguished, but crept along the insulation of the wires (weatherproof) in a furred wall and broke out later in the attic.

In some of these fires, damage to the extent of $200,000 was done, making it apparent that it pays to look carefully after the wires.

The A. D. Reid Co., of Toronto, have been awarded a contract for the construction of an incinerator by the city of Stratford, Ont.

MICSELLANEOUS QUERIES.

Editor Canadian Machinery:—I would be much obliged if you would answer through the paper the following problems:

(1)—How would you determine the crushing strength of a plain furnace?—A. Langridge.

Answer.—Formulae for the determination of the strength of furnaces and flues cannot be deduced by direct reasoning, and are, therefore, the results of experiments. The most used formula, known as Fairbairn's, is $p = 9{,}675{,}600 - \frac{t^{2.19}}{l\,d}$

Where p=pressure in lbs. sq. in.
t=thickness of metal in inches.
l=length of flue in inches.
d=diameter of flue in inches.

For all practical purposes t^2 may be used instead of $t^{2.19}$ and the formula becomes $p = 9{,}675{,}600 - \frac{t^2}{ld}$

The British Board of Trade prescribes the following formula for welded flues:

$p = \frac{90000\ t^2}{(L+1)\ d}$ L = length in feet.

For lap joints and inferior work the 90000 may be reduced as low as 60000, according to judgment of the engineer.

Example.—What would be the crushing strength in pounds per sq. in. of a flue ½-in. thick, 10 ft. long and 30-in. diameter?

From formula, $p = 9.675600 \times \frac{(\frac{1}{2})^2}{10 \times 12 \times 30}$

or $p = 9{,}675{,}600 \times \frac{\frac{1}{4}}{10 \times 12 \times 30} = 671.6$ lbs. per sq. in.

Or the working load using a safety factor of 6 would be $\frac{671.6}{6} = 112$ lbs. sq. in. approximately.

(2)—How do you determine the load that can be supported at the centre of an iron beam, the tensile strength of the material being known?

Answer.—The standard beam formula is $\frac{M}{S} = \frac{I}{C}$

In which M=maximum bending moment. This depends upon the manner and amount of loading. For a concentrated load in the centre of a beam the bending moment would be $\frac{PL}{4}$ where P=load and L=length. If the weight of the beam itself is to be considered the bending moment of the beam or dead load would be $\frac{WL}{8}$ where W = total weight of beam and L = length. For total moment these two should be added together.

S = maximum tensile stress in the material in pounds per sq. in.

C = the greatest distance from the centre of the beam to the outside.

I = moment of inertia, the value of which can be found in most engineers' or steel hand-books. Thus, for a rectangular beam placed on edge I would be $\frac{6d^3}{12}$ — where b = breadth and d = depth.

For regular rolled sections, the values of I for all sizes are given in the steel hand-books.

Example.—What concentrated load could be supported by a steel beam placed on edge, 1 x 6 x 4 ft., between supports. Allowable stress=20,000 lbs. sq. in.

Formula, $\frac{M}{S} = \frac{I}{C}$ or since $M = \frac{PL}{4}$

Formula, $\frac{PL}{4S} = \frac{I}{C}$ or $P = \frac{I \times 4S}{CL}$

$I = \frac{bd^3}{12} = \frac{1 \times 6^3}{12} = \frac{1 \times 216}{12} = 18$

C = 3 in.
S = 20000.
L = 48 in.

or $P = \frac{18 \times 4 \times 20000}{3 \times 48} = 10000$ lbs.

or half a ton.

Note.—In this case the weight of the beam is not considered.

Repairs and Welds by Electricity.—In a paper on "Repairs and Welds by Electricity," presented before the Ohio Society of Mechanical, Electrical and Steam Engineers, it was stated that a large locomotive shop operating an electrical welding apparatus, having made a careful tabulation of the total cost of the repair work, including material, time of the operator, the current and overhead charges, obtained an average cost of 1 cent per minute. The saving effected by this method is shown in the following example:—The cost of repairing forty cracks in side sheets of fire-boxes by means of the metal electrode method was $6.35, while to renew the damaged parts would have cost about $1,300.

TEAM WORK IN A BRASS MANUFACTURING PLANT.

By P. W. Blair.

UP-TO-DATE brass manufacturing plants, making plumbing, steam, gas and water-works brass goods have in the past few years installed many of the latest and most up-to-date tools and machines for the production of their goods, with the result that the quality and diversity of these latter have increased in proportion.

The brass foundry, viewing it from all points, presents a unique problem in the mechanical line. The process of work in the machine shop, finishing departments, or pattern ship is more or less mechanical, and because of this, individual ability stands out more prominently than in the foundry. Mechanical ability is not, however, lacking in the foundry, and if the work produced were dependent only upon the skill of the individual molder, the efficiency of that department would measure up equal at least with other branches of the plant. The production of castings, however, is dependent not only on a mechanical process, but also on a chemical process. Even with the most up-to-date methods, it is impossible to individualize mechanical ability, or with any degree of certainty to fix the responsibility for defective work, and yet there is a reason for the loss of every spoiled casting. Some one unit of the department failed in performing its part of the work correctly.

Causes of Defective Castings.

It may have been due to the careless work of the molder in making the mold or pouring it; it may have been due to lack of care on the part of the coremaker in making or venting the core; it may have been due to poor judgment in the selection of sand not suited to the class of work to be produced, or it may have been due to poor tools and appliances. A purchasing agent, in order to save a few dollars, may buy poor grade materials, such as copper containing aluminum, which, through ignorance on the part of the melter, might be used for hydraulic fittings, and the mistake not discovered until the castings failed under test, when it is too late to correct the error. Again, the failure may have been caused by bad scrap or poor furnace practice. The fault lies somewhere, and a systematic search or inquiry should reveal the cause and fix the responsibility upon someone.

In the other departments aside from the foundry, mechanics can forge ahead of their fellows and become experts in their particular line. They can individualize their work and reap the benefit of their skill. In the foundry, however, all the skill possible for the molder to possess could not prevent the loss of his work if the other units of the department failed to do their part with equal skill. The foundry is in a class by itself in the mechanical world. Instead of working for individual records, team work must be established. Every element, every unit must work with but one purpose in mind: the success of the department in the production of perfect work not part of the time, but all the time. When the finishing departments receive perfect castings they may cut the cost of manufacture as much as 10 per cent., because true and unwarped castings are machined more readily and are handled with ease, as they accurately fit the jaws of chucks or jigs in the course of manufacture.

In a Class By Itself.

A certain portion of the work in a foundry is intrusted to unskilled help, to men who do not understand the necessity of following out to the letter the instructions given them; who cannot see how far-reaching the effects of their indifferent work may be, what loss it may cause, or the wrong reflection it may cast on the ability of the molder. Such men cannot be blamed for something they do not know, but they can be helped and taught to perform their part of the work as well as the necessity of attaining perfection in it.

To emphasize the necessity for team work in the foundry, a lesson can be learned from watching two hockey teams in a game. The writer witnessed two crack Ontario teams—the Kingston Frontenacs and the Sarnia Independents—engage in a match game on January 31. The success of any hockey team is dependent first on skill, and second on team work, the latter being just as necessary as the former. The greatest responsibility in a hockey game rests with the goalkeeper, but let him be ever so skilled in his profession he will go down to defeat if the other units of the team do not support him. The lightweight Kingston players with their team work and brilliant defence of their goal were able to hold a heavy-weight and highly skilled individual team to a tie score in one of the fastest games ever played in Sarnia.

There is no reason why any up-to-date brass manufacturing plant cannot be brought up to as high a state of skill and perfection as in any other branch of mechanics or trades. All it requires is to adopt the team work idea, and install an educational system that will bring the various working units up to a thorough understanding of their duties. Every man must be taught to recognize and understand the responsibility of his work, and to do it along this line. Every unit of these departments must be impressed with the fact that some one man's work, if improperly performed, will lead to the loss of some particular job.

The old foundry slogan, **any molder is liable to lose a casting,** was not coined because of a desire on the part of the molders to admit that they lacked mechanical ability, but because it has always been recognized that too many things entered into the production of their work, some of which might easily prove faulty. Molders as a result have recognized that they were individually helpless in their efforts to be perfect. It is a big task to bring about perfection in a brass manufacturing plant, and more especially in the foundry, but it can be done, and up-to-date plants will do it for economic reasons, as well as for the sake of raising the efficiency of the molder up to a level with the mechanics in other departments of the plant. That the molders would give such a move their hearty support goes without saying. They would hail with delight any system that would help them to attain greater perfection and relieve them of the strain of carrying the burden of responsibility for the production of defective castings for which, in the majority of cases, they are in no way responsible.

The men in viewing this question must get one thought imbedded in their minds. If a worker is not wholly to blame for poor castings, then from the same viewpoint he is not deserving of all the credit for perfect work. The same factors that entered into the production of the imperfect castings were apparent in the production of the perfect work, except that in the latter case men worked in unison and perfect team work was accomplished. He must recognize that, in the face of all the skill he may possess and display in his work, his

efforts may go for naught because of the lack of skill displayed by one or more of his team mates, and whose efforts are just as essential as his own for the success of the work produced.

GIANTS AND WEAKLINGS.

By James E. Cooley.

The great workers, they who have done the really great things, the things that endure, that lift men up from one stage to another, are very few in number compared with the teeming millions of inhabitants on this vast globe. We know who they are, among the living and the dead; we know of their achievements and the benefits that have resulted from their labors. Set apart and gazed at by the world, they occupy but a very small space on the surface of the earth; a few square miles at the most. It is estimated that the earth's surface is about 200,000,000 square miles, and, it is readily seen there is still plenty of space for a few more notables, a few more capables, a few more individuals who can become great.

The seemingly little efforts that have become great achievements, the seemingly small things that have become wonders, were first wrought and thought in the brain of man. There are no accidents or circumstances in this life that lead men to greatness. Hard pulling strokes, intensified thinking coupled to intensified action is what does it. Your whole life is daily mapped out keyed up by your thoughts or the number of these that develop into actions.

When a new invention has been brought forward, there are those who rise up and try to get the credit for what another has done on the ground that they had thought of the same thing before. Failure to put a thought into action bars every claim, for he that thinks must also act. The whole secret of success or failure depends on the largeness of thought, and the extent to which that thought is put into action. Greatness comes or mediocrity continues according to its goodness, its hard hitting, telling action on the one hand, or its baseness, weakness and fickleness on the other. You cannot move without taking thought. It takes the same amount of thinking to go downward to disgrace and defeat, as it does to go upward to distinction and victory.

Thought put into action is the secret of life's great achievements. The conveniences you have, the benefits you enjoy, never come of themselves — never just happen so. They have come by hard, vigorous thoughts and actions, the work of brain and muscle, from a head with bulging temples and distended veins, and hands whose grip is vise-like.

Out there in the passing, lagging throng, some one brain is going to generate a new thought that when developed into action, will infect other minds and bodies and turn that throng into hustling, bustling beings. Somewhere, some day, on the great highways of the world some one will produce a thought and turn it into action that will advance the world forward one hundred years. Will it be your brain that will do this? Will it be your brain that will cause a listless race to wake up? Will it be your brain behind the hand that will pull the throttle over to speed on faster the car of progress?

We marvel when we think of the things that have been done. We ought to marvel more at our backwardness, deadness, our slow movements. We ought to advance faster, we ought to accomplish more. There ought to be more great men among the numbers that people this earth. There ought to be more giants than weaklings. There is a great deal to be done. Everything is possible to him who thinks and then goes ahead, to him who thinks and puts those "thinks" into action. Thoughts are not things until they materialize, and they don't materialize till the brain that produces them, converts them into visible, humanly useful objects.

Every object was once a thought before it became what it did, everything animate or inanimate was once a thought, even the creation itself. Know then this fact, that "thought put into action" is the answer to the riddle of the universe. Just by thinking, and belting up your thoughts to vigorous action you will "strike your gait," and make the world sit up and take notice.

Here then is your opportunity. Just one new thought put into action, some one strikingly useful thing, and your name is on every tongue. Posterity will know you by that one thought; will know you for the interest you took in the world in your own day and theirs, a labor for the betterment of mankind which will have come down to them; know you as a great famed figure painted on stretch of canvas that will hang in the "gallery of the world's achievements."

Here, you see, opportunity awaits you; here you see what a thought will do for you; here's your hope, here's your chance, here's for you immortality.

UNIFORM BOILER RULES FOR ALL CANADA.

Representatives from every province in the Dominion, with the exception of Alberta and Manitoba, are meeting at the Parliament Buildings, Toronto, to consider uniform boiler inspection regulations for all Canada. At the present time Alberta, Saskatchewan and Ontario have uniform regulations. British Columbia has regulations that vary somewhat; Manitoba is about to adopt a series, while the other provinces are merely in the "considering" stage.

The conference is of considerable importance to boiler manufacturers, and their representatives will doubtless keep closely in touch with the sessions. If uniform regulations are adopted it will mean that boilers inspected and passed upon during construction can be sent to any part of the Dominion and put into operation without further inspection or suffering any penalty in pressure imposed as a safeguard.

Those attending the conference are J. Peck and R. N. Blackburn, chief inspectors of boilers in the Provinces of British Columbia and Saskatchewan respectively; W. G. Matthewson, of Nova Scotia; P. T. Tobin, inspector of public buildings, Province of Quebec; and D. M. Medealf, chief boiler inspector, Province of Ontario.

CANADIAN KODAK CO. NEW FACTORY.

Work has been started on the new plant which the Canadian Kodak Company will erect at Kodak Heights, in Mount Dennis, where they own a parcel of 25 acres of land, of which twelve hundred feet has frontage on the Canadian Pacific Railway tracks. Since 1900 this company has had to build three times to take care of its growing business, and it is the intention to transfer the entire industry, now located in three buildings on King Street west, to the Kodak Heights works as soon as they are completed. The officials of the company anticipate that the new plant will be ready in about two years at the outside.

Buildings have been specially designed for the manufacture of kodaks and other cameras, film, dry plates, photographic papers and sundry articles for photographic use. The new plant will consist of seven buildings, with a floor area of more than 480,000 square feet, or about 11 acres. The largest building will be 460 feet long by 80 feet wide, five storeys high. The plans call for reinforced concrete construction, with metal sashes glazed with wire glass.

The power plant is designed to accommodate boilers of 3,000 horse-power, with an immediate installation of 1,500 horse-power. Electrical energy will be supplied by three steam-driven generators, with a capacity of 1,000 horse-power. A striking feature of the power plant will be a chimney 200 feet high and 9 feet in diameter at the top.

Reuben R. Penney has been appointed harbor master of the port of Barrington, N.S.

Arithmetic for the Machinist and Workshop Operative

By J. H. Rodgers

With the further development of this course in arithmetic, it will be found by those who have followed the introductory lessons and profited by them that the various practical applications resulting from the succeeding lessons will be easily observed and their time and labor-saving features so appreciated as to be adopted at every available opportunity.

THREAD CUTTING.

THE practice of screw-cutting on the lathe involves some interesting and often complicated figuring in arithmetic; and while the modern lathe, to some extent, eliminates the changing of gears for the different pitches of screws being cut, there are still many lathes, both new and old, with the old style of change gears, which must be calculated and set up for each different pitch of screw; in fact, the necessity of having one or more of these lathes in a plant, especially in jobbing shops, where many threads of odd pitch are constantly being met with, will appear quite evident, as the majority of quick-change gear lathes have only a specified number of pitches which can be cut.

A workman after operating a quick-change gear lathe for any length of time, will have some trouble figuring out a train of gears for an odd pitch which must be cut on another lathe. When cutting threads in the lathe, the saddle upon which the cutting tool is rigidly secured must travel in a certain relation to the speed of the lathe spindle in order to cut the required pitch.

Now, as the master screw or lead screw always remains the same, it will be seen that the train of gears connecting the lathe spindle with the lead screw must be so arranged that the proper ratio between the lead screw and the thread being cut will be retained. In the majority of lathes the spindle stud which carries the first of the change gears is usually placed somewhat below the lathe spindle, and in most cases has a ratio to the lathe spindle of 1:1; that is, one revolution of the lathe spindle will give one revolution to the stud S. (Chart 22.)

On a lathe having a lead screw L of four threads per inch, it is desired to cut a thread having four threads per inch. The ratio between the lead screw and the thread being cut is seen to be 4:4 or 1:1; then the gear A must have the same number of teeth as the gear D. The intermediate gear B connects the gears A and D, but the gear B in a single train has no effect on the ratio of A and D.

By formula. A:D=L:T.

40:40=4:4.

Suppose we wish a screw of 1/10-in. pitch or ten threads per inch cut on the above lathe. The ratio in this case becomes A:D=L:T, or A:D=4:10=1:2½.

Select a gear for A, with a small number of teeth and divisible by 2, say, 30. Then by formula.

$$D=\frac{A\times T}{L}=\frac{30\times 10}{4}=75 \text{ teeth.}$$

When selecting the gear A for stud S, always take one that is divisible by the denominator (if any) of the fractional part of the ratio.

Required to cut 11 threads, with a 4-thread lead screw.

Ratio=4:11=1:2¾.

Select for gear A one that is divisible by four, as 20, 24, 28, 32, etc. When gears increase by 5 we must take 20 or 40. Then,

$$D=\frac{A\times T}{L}=\frac{20\times 11}{4}=55 \text{ teeth.}$$

Discretion must be used when selecting gears, so that those belonging to the lathe will work into the solution. To cut 11½ threads with a 4-thread lead screw, gears increasing by 4 from 24.

Ratio=4:11½=1:2.875

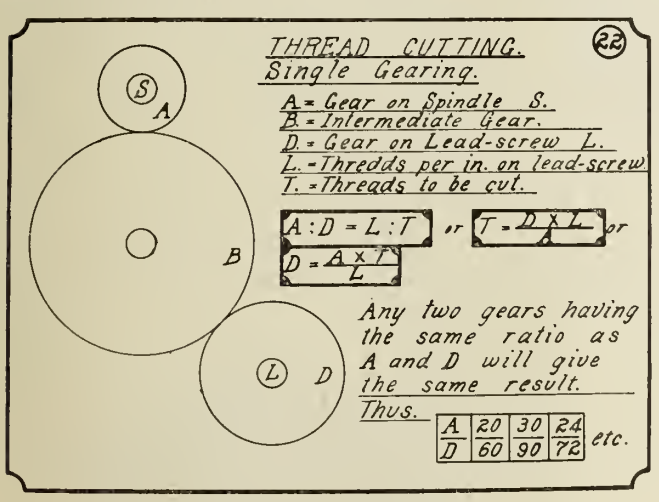
$$D=\frac{A\times T}{L}=\frac{24\times 11.5}{4}=69 \text{ teeth.}$$

or, taking gear of 32 teeth for A, we have

$$\frac{32\times 11.5}{4}=92 \text{ teeth.}$$

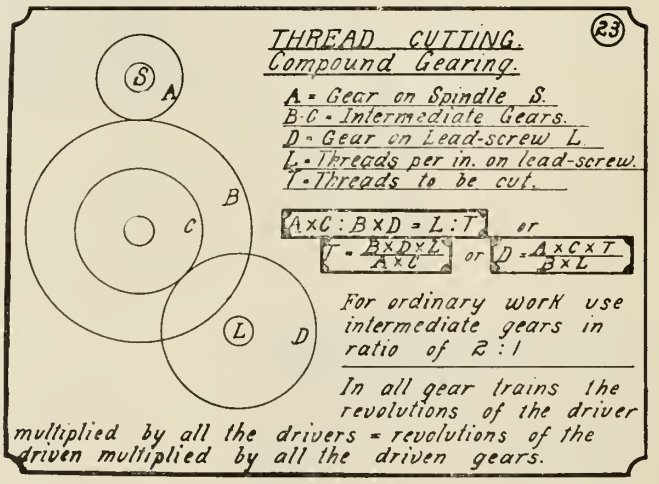
Suppose we have a thread of 1/16-in. pitch (16 threads per inch) to cut with a 2-thread lead screw, gears increasing by 5 from 20.

Ratio=2:16=1:8.



then, using gear of 20 teeth on stud S we have

$$D=\frac{A\times T}{L}=\frac{20\times 16}{2}=160 \text{ teeth.}$$



Now it seldom happens that a gear of 160 teeth goes with the lathe, and it becomes necessary to compound the train of gears connecting the stud with the lead screw. To accomplish this we divide 160 by 2, which gives 80 teeth for the gear to use on the lead screw; then for the intermediate pair C and B (Chart 23) we must select two gears having a ratio of 2:1, or 60:30, or 90:45, etc.

By formula, A×C:B×D=L:T, therefore,

$$T=\frac{B\times D\times L}{A\times C}=\frac{60\times 80\times 2}{20\times 30}=16 \text{ thds.}$$

ARITHMETIC CHART 22.

ARITHMETIC CHART 23.

Mellen's Creed and Maitland's Prayer Contrasted

If any are still skeptical of the development and progress being made in the elimination of the purely mercenary feature in the administration of our large industrial and commercial enterprises, the following article culled from the Chicago Evening Post may be worth their careful study. Readers generally, we presume, are more or less familiar with New Haven Railroad affairs.

"ALL I was after was results for the New Haven road, and I would have done business with the devil himself, if necessary."

Charles S. Mellen here put into words the spirit of a day that is gone.

Set over against it an incident of the day that is coming.

At the annual meeting of the United States Steel Corporation a few weeks ago, Chairman Elbert H. Gary presided, but among the stockholders all were not of the type that this powerful name suggests. There were in the crowd stockholders in the United States Steel Corporation who were "puddlers" and "heaters" and "rollers" in the company's mills.

Workmen Express Confidence.

One of these was Samuel Wilkinson, who is a working man in the Elwood City plant. He came as the representative of 921 stockholders who work in that plant. He brought no complaint, no grievance. "The funniest thing," he said, "is that not one of the working men has been to me since I was chosen by them to come here and told me to say anything. They just put their confidence in me to tell what the working men think of the corporation."

He told it. He said that the men thought "a good deal" of the corporation, and he told why. He told how the company's sanitation campaign saved its workers from being exposed to swarms of insects, to foul drinking water, to the rain and the snow. He was "not here to praise the company," but its accident-prevention work made it safer for him and his fellows to go to work without taking their chances in crossing unguarded tracks. He said that the "safety devices" on the machinery were "working fine."

Safety Campaign Results.

Chairman Gary had pointed out that this campaign had cut down the accident roll until it was 38 per 1,000 men less than in 1906. "This means that 2,273 men who might have been injured under earlier conditions were saved from serious injury during the year." In 1913 the corporation spent $600,593 in this work.

No Higher Tribute.

Samuel R. Maitland, stockholder, and "water tender at 3 and 4 boiler house" in Newcastle, Pt., took up the story that Wilkinson began. "The workers at Newcastle are pleased with conditions." The vacant lots have been cleaned by the corporation and made into parks. There were playgrounds for the children. There were visiting nurses. There was the safety campaign, which kept the "mothers from having their boys crawl home to them cripples," and there was the pension system. An old man meets me on the street and says: 'I am on the pension roll.' I say: 'You ought to thank God for that.' He is not a pauper.

Then came the most moving incident of all. This simple workman said in closing: "We ought to look up and thank God for this great corporation, which is taking care of humanity in this large way; and now, if you will just bow your heads, we will offer up a little prayer, if that will be all right."

"Of course, there is no objection," said Mr. Gary. And the workman prayed: "Our God, we thank Thee for these officials and these good men who have taken such an interest in the welfare of humanity, and rejoice in our hearts for the blessed privilege of looking up to Thee in thankfulness for it. We would pray for the man who works and for all who keep us together as one great family and organization. In Thy name we ask it. Amen."

The simplicity of the man's assumption that nothing could be more fitting than a religious interpretation of this new spirit of "big business" was a finer tribute to the Steel Corporation's sincerity than all the approval of scientific sociologists. To him, these men whom Mr. Gary personified were but carrying on the work of the Lord. They were applying on earth His gospel of justice and mercy. It was but proper to offer thanks to the Source of All Good.

When Mr. Mellen grates out the harsh gospel of the old order, a watchful press dramatizes it before the people. When a working man phrases in dramatic surroundings the new spirit of the industrial age, a strange perversity makes us ignore it and keep it out of our headlines. Yet, to our mind, the words of Samuel R. Maitland, water tender, are more significant to-day than those of Charles S. Mellen, the former chieftain of the New Haven. The one breathes the appeal of unscrupulous selfishness to the devil himself. The other lifts up its eyes unto the hills from whence must come the help which will solve for us the troublous problems of industry.

To-day, as the United States faces in the New Haven probe a drama that may be as great as that of the Hughes life insurance investigations, "Maitland's prayer" should find in the consciousness of the public as firm a place as Mellen's malignant creed. The one preaches despair, the other hope. It is the old against the new, as we measure economic eras, but in the larger measure of time, the "new" is itself as old as the world.

TRADE COMMISSION SITTINGS IN TORONTO.

The itinerary for the Dominion's Royal Commission, the Imperial trade body, which will arrive at Sydney on August 3, and will travel across Canada taking evidence in regard to every phase of Canadian trade, has been arranged.

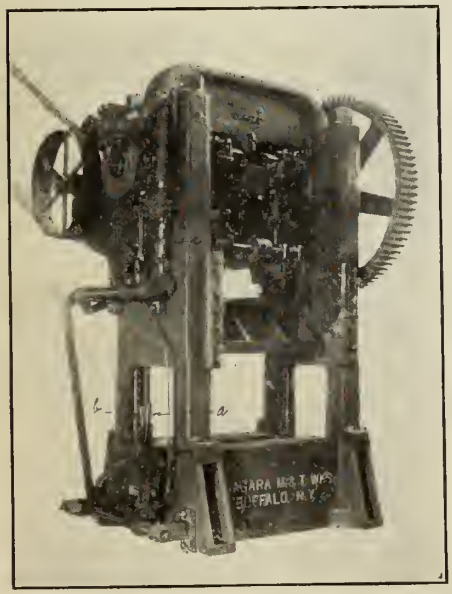
The commission will be in Montreal on August 24, 25 and 26; in Ottawa, August 27, 28 and 29, and in Toronto on September 1. A number of excursions to Hamilton, Niagara Falls and other places will be taken from Toronto, while several days will be spent in Western Ontario. The commission will then leave for the West, and will arrive in Winnipeg on September 15. Thence it will proceed to Regina, Edmonton, Calgary, Banff, the Okanagan Valley, Vancouver and Victoria.

A great deal of information is now being secured and arranged by experts in advance of the commission's arrival. Among the subjects on which information is being secured are ocean freight rates, the most important matter with which the commission will deal; duties, patents, fisheries, forestry, mines, taxes, irrigation, grain inspection, development of harbors, etc. A quantity of such information which has already been prepared was lost when the Empress of Ireland went down, and has to be replaced.

A number of witnesses will be heard by the commission during its meetings in Montreal and other big Canadian cities. The St. Lawrence route, it is understood, will be one of the chief matters dealt with. Ocean freight rates is also a topic upon which it is expected the commission can obtain considerable light in Montreal, and it is probable that a considerable portion of its time in that city will be spent garnering information in connection therewith.

James Buchanan, of James Buchanan, Ltd., Liverpool, England, has arrived in Halifax, N.S., in connection with the installation of machinery which his company has supplied to the Acadia Sugar Co., of Dartmouth, N.S.

PROGRESS IN NEW EQUIPMENT



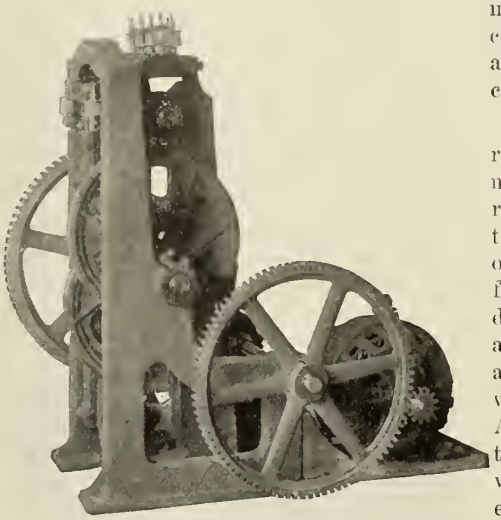
A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

DOUBLE CRANK PRESS WITH CLUTCH SAFETY CONTRAL.

THE accompanying illnstration shows a large press with a novel device to control the action of the clutch and the motion of the slide. It permits the stopping and starting the friction clutch at any time during the downward motion of the slide, and will also stop the crosshead automatically in the highest position. The clutch is non-repeating. The controlling hand lever returns automatically to its starting point, and is locked in position after the slide reaches the highest point.

In order to start the clutch the operator takes hold of lever A, at the same time disengaging the locking lever B. Pulling the lever A forward to the outer end of the segment, engages the clutch. The lever B controls the action of a plunger engaging the connecting-rod C, i.e., when the lever B is disengaged the connecting-rod C is also released, and the clutch lever A is free to be moved forward to engage the clutch. The return motion of the clutch lever is accomplished by a cam fastened to the outer end of the crank-shaft.

This machine has been designed and built by Niagara Machine & Tool Works, of Buffalo, N.Y., and the improved feature can, we understand, be applied to other sizes and types of presses equipped



DOUBLE CRANK PRESS WITH CLUTCH SAFETY CONTROL.

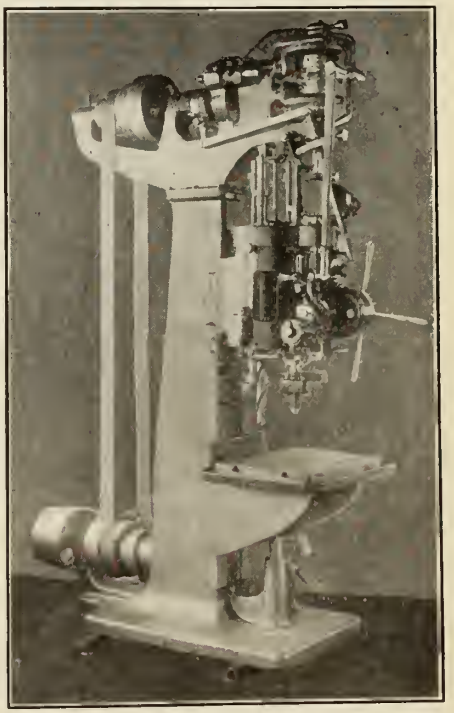
with friction clutch. The press illustrated has the same conveniences for adjusting, etc., as other large presses built by the Company, and the driving mechanism being arranged overhead, makes the machine accessible from all sides.

A NON-PULSATING PUMP.

Interest in the pump shown in the illustration lies in the fact that the pistons are not operated from a crank shaft, as in the ordinary type of re-

A NON-PULSATING PUMP.

ciprocating pump, but by cams. The cams are keyed to the main shaft and each transmits its motion to its piston by means of a sliding yoke, rollers being used to minimize friction between the cam and the yoke.



The manufacturers claim that this construction keeps the load on the piston uniform instead of passing through a cycle running from full load to a complete stop and back again, as in the crank shaft pump. Hence there is no pulsation, less strain on the pump, and high efficiency owing to the absence of backlash when gears and other parts become worn. In fact the manufacturers guarantee an efficiency of 80 per cent. for the pump, which is higher than can be obtained from the ordinary crank shaft pump.

The Luitweiler Pumping Engine Co., Cleveland, Ohio, are the manufacturers, while Westinghouse Electric Co. motors are used for the drive.

AUTOMATIC VERTICAL TURRET.

Among the new designs of metal working machinery, our attention has been called to the new automatic turret machine, known as model F, just completed by the Turner Machine Co. in their Danbury, Conn., plant. This machine is designed for heavy duty, and is intended to complete a series of operations without shifting the position of the work or changing the tools. Each spindle carries a different tool which successively and automatically registers in precisely the same position. The automatic feature is neither cumbersome nor complicated, so that the machine can be operated by the average workman at full capacity and with extreme accuracy.

The column and base are cast integral, the column being rectangular, internally ribbed and cross-braced. The turret is vertical, revolving horizontally; the rotation being automatic. When the operation returns the spindle to its full height, the turret automatically indexes to the next spindle. The detents are adjustable, both for wear and accuracy, and are made of special chrome-vanadium ball race steel, heat treated. As the detents are located further from the center of the turret than are the working tools or spindles, the most extreme accuracy is obtained and maintained. Spindles are of heat treated nickel steel, with guaranteed elastic limit of 90,000 lbs. per square inch, ground their entire length.

TURNER AUTOMATIC VERTICAL TURRET.

The spindles and their driving gears on the vertical shaft are of chrome nickel steel, heat treated, while F. & S.

TOOL CHEST NO. 766.

ball thrust bearings are under the spindle gears on top of the turret, and at the bottom of the spindles to take the upward thrust of the tools. The feed mechanism is driven from the vertical shaft, which drives the spindle. Feed may be engaged and disengaged without stopping the machine, an automatic trip being provided to throw the feed at a pre-determined travel of the spindle, which may be set as desired.

The feed gears are enclosed in a dust-proof case, and provide four feed changes, with direct drive on the coarser feed. The feed gears in connection with the two different spindle speeds give a possibility of eighty feed changes for the machine. The feed is actuated by helical gears, resembling worms and worm gears. The worms are made of chrome nickel steel, heat treated; while the worm gears are special hard gear bronze. The spur gears for the gear changes are of stub tooth form, cut by Fellows' process. The feed gears do not run except when in use. Three sets of worms and worm gears are used in the feed. The first two sets run at higher speeds and lower pressure than the final sets, and the thrust of the first two is taken by multiple washers and the last by a ball thrust.

The spindles may be fed, either by the hand lever or hand wheel. The latter is more sensitive, thereby adapting the machine for profiling and similar milling jobs. Inactive spindles are positively locked in their extreme upper position, and as each spindle is automatically swung into its working position its positive lock releases, and its weight is carried by an adjustable spring; one spring only being used for all of the spindles. The spindle projects approximately 1½ ins. beyond the sleeve, a ball thrust bearing being interposed between the nose of the spindle and the end of the sleeve, while the bearing is packed with grease and surrounded by a dust excluding brass collar. The sleeve is 12 11-16 ins. long, and the spindle has a bearing within the sleeve of four inches at each end, with an oil chamber in the center. The upper end of the spindle is guided in the turret, the turret being 17 ins. long. This method of supporting the spindles so close to the nose, together with the long bearings placed far apart gives exceptionally rigid support and guidance. The absence of universal joints and consequent intermittent motion and angular pressure, obviates much wear, chatter and breaking of tools. Another feature which makes this machine, even though massive and powerful in construction, suitable for small or delicate tools, such as small drills, taps, etc., is that each tool may have its own individual feed which may be hand fed if desired.

The back gears are operated by the Carlyle & Johnson friction clutch, and may be rocked out of engagement like

TOOL CHEST NO. 767.

the back gears of a lathe when not in use. All gears except bevels, are cut by Fellows' process, the bevels being cut by the Bilgram process, with teeth of spiral form. This construction insures silence and smoothness of drive.

TOOL CHEST NO. 765.

The tapping gears operate the reverse of the tap or die at a ratio of one and six tenths to one, and may be disengaged by means of an intermediate gear when not in use. The back gears and

TOOL CHEST NO. 765.

tapping gears may be engaged and disengaged without stopping the machine, and positively without shock. All controls are within easy reach of the operator.

The slotted table is strong and well ribbed and has a working surface of 18 in. x 23 in.; the oil channel being of ample dimensions to prevent its overflowing. A gear-driven oil pump with large oil tank and a separate flexible oil supply pipe, furnish oil to the cutting tools. The table is separate from the knee, and has a three-point support thereon. All shaft bearings are renewable, special bronze bushings, and lubrication is wherever possible by compression grease cups, while all gears are encased to meet safety requirements.

To change the machine from one job to another, it is only necessary to change the tools for the successive operations to be performed, and place the proper jigs to be used on the table. Each tool comes to the same center automatically, until the successive operations are completed.

TOOL CHESTS.

The L. S. Starrett Co., well-known makers of fine mechanical tools, have put on the market three styles of chests as illustrated.

No. 765, the finest grade made, is covered with best leatherette with highly polished solid mahogany drawer fronts.

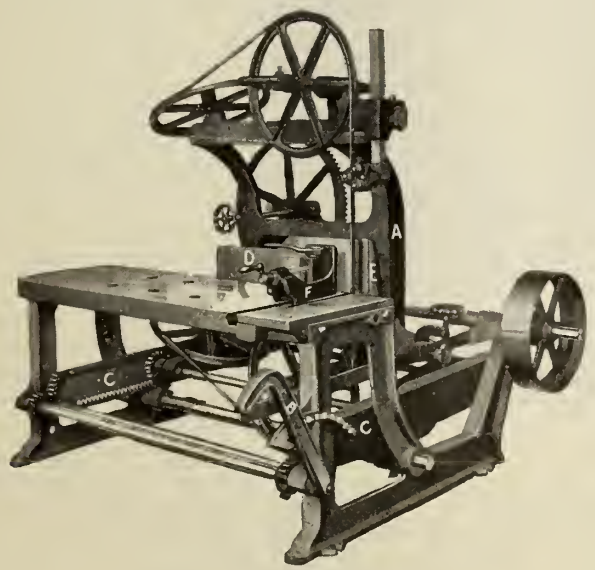
The drawers and till are lined bottom and side with best grade of green felt with special patent locking arrangement. The corners are raised and there is a nickel-plated mirror in the top of the till. The outside dimensions are 20 5-16 inches long, 7⅝ inches wide, and 12⅜ inches high, while the shipping weight 17 pounds. The till is three in-

ches deep, and the large drawers 18¼ inches by 6 inches.

Two lower priced chests, Nos. 766 and 767 are similarly constructed, but of different material. No. 766 is made of best grade quarter-sawed oak with five top drawers lined with green felt. The outside dimensions are 17 inches long, 7⅝ inches wide, 12⅜ inches high, with shipping weight of 16 pounds.

No. 767 is made of hazelwood thoroughly kiln dried. The finish is satiny walnut. This chest is light and strong, and conveniently arranged; its outside dimensions being 17 inches long, 7⅝ inches wide, and 10¾ inches high. The shipping weight is only 13 pounds.

VERTICAL METAL BAND SAWING MACHINE.



For cutting metal to various lengths and at any desired angle, M. E. Shinn & Co., Chicago, Ill., have developed a new type of vertical gravity feed metal band saw machine, which is entirely automatic. One of the features about it is the way in which the non-cutting part of the blade is returned so as not to interfere with the material being cut.

As will be noticed from the accompanying cut, the machine is designed so that there is nothing to interfere with the metal irrespective of the length that is being cut. By means of an adjustable radial back, and the vise which operates in a groove in the table, the material can be cut at any desired angle. By removing a cap screw, the lug at the right of the radial back can be removed so that the table is entirely clear and any length can be sawed longitudinally, there being a clearance of 8 in. between the saw and arbor frame.

The saw arbor is mounted upon four ball bearing wheels, two of which have gears attached. These travel in channels to guide the saw arbor in alignment. The inclination of the plane of the trackway is altered by the operating lever at the right side of the machine below the table which regulates the feed. By this arrangement the cutting part of the saw is kept in a vertical position during the entire length of the cut, and the gravity feed is constant throughout the operation and can be accelerated or retarded by the operating lever according to the size of the material being cut.

The non-cutting part of the blade is returned by passing over wheels in such a way as to obviate any interference with the material being cut. At the same time the cutting edge is left perfectly vertical and free from twist, while passing over the two wheels which carry the working part of the saw. In this way it is emphasized that the saw runs straight in the line of the cut and accuracy in cutting and longer life to the saw band are insured.

The action of the saw is entirely automatic, as after the cut is completed the saw is brought to a stop so that it can be adjusted to any width of material. This stop operates a clutch attached to the drive pulley on the machine and can be adjusted to suit any width of the material, the saw having a cutting capacity up to 11 x 12 in. The saw used is 15½ ft. long, ⅝ in. wide and 0.0312 in. thick. At ordinary operating speed this machine will cut cold rolled shafting 2½ in. in diameter in 3 min., or 6 in. in 23 min.

METAL BAND SAW MACHINE.

The floor space occupied by the machine is 14 sq. ft., measuring 45 x 45 in. The table is 42 in. long and is 18 in. from the floor. The crated shipping weight is 450 lb.

While the machine illustrated is designed for belt drive, back geared motor drive can be supplied if desired.

CANADIAN TRADE.

A statement of Canadian trade for the last fiscal year has just been issued by the Trade and Commerce Department. Total trade in merchandise for the year was $1,073,766,098, an increase of $26,697,554 over the preceding fiscal year. Imports totaled $618,328,874, a decrease of $51,671,315, while exports totaled $455,437,224, an increase of $78,368,869.

The net increase in trade for the year was due to the big gain in exports of agricultural products, animal produce and manufactured products, particularly during the autumn months. Since then there has been a considerable falling off both in imports and exports. The total exports of agricultural products for the year was $198,220,029, an increase of $48,074,368, or nearly thirty per cent. Exports of animal product totaled $53,349,119, an increase of $8,564,526, and exports of manufactures totaled $57,443,452, an increase of $13,750,644.

There was a much greater movement of coin and bullion during the year than during 1912-13. Imports of coin and bullion totaled $15,325,305, an increase of $9,807,326. Exports of coin and bullion totaled $23,560,704, an increase of $7,397,002. In the liquidation of balances, Canada thus sent out of the country $8,325,399 more of gold and bullion than was brought in.

Trade with the United Kingdom showed a net increase of $37,634,098. Trade with the United States showed a net increase of nearly three millions. With the British West Indies, including Bermuda, despite the recent reciprocal trade agreement, there was a net falling off in trade of $1,620,287. From nearly every country imports decreased, while to every country, except the Argentine Republic, exports increased.

From the United Kingdom, Canada took last year imports valued at $131,942,763, or $6,706,666 less than the preceding year. Canadian exports to the United Kingdom totaled $222,322,766, a gain of $44,340,764. Imports from the United States last year totaled $410,786,091, a decrease of $30,369,764. Exports to the United States totaled $200,459,373, a gain of $33,348,991.

Statistics of trade with the West Indies show imports of $4,354,849, a decrease of $1,662,281; an export of $4,770,200, a gain of $41,998.

W. C. Brennan has been appointed works commissioner of Fort William, Ont., in charge of construction and maintenance of roads and sewer work, etc. Mr. Brennan was formerly secretary of the Department of Public Works at Hamilton, Ont., and has held similar positions in various parts of Canada for the past twenty-four years.

SINCERITY ADVERTISING.

FROM June 21 to 25, the Associated Advertising Clubs of America held their annual convention in Toronto. Not only were new records established in point of members attending as compared with kindred gatherings on Canadian soil, but there was borne in upon our people with a renewed forcefulness, the fact that public mediums, whereby the products of the farm, the mill and the factory are brought vividly to their notice, are neither superfluous for their intelligence development nor given to misrepresentation or exaggeration. Relative to the foregoing, subscribers to **Canadian Machinery** are invited to take a keener interest in and develop the habit of studying its advertising as well as its editorial, the combination feature producing more immediate and greater returns.

The old order changeth, and although our policy has always been truth and sincerity at any cost, the practice has been far from universal. While appreciating therefore the general advance now being made, we simply reiterate former appeals to our readers to appropriate to themselves the benefits derivable from closely scrutinizing the offerings of those who advertise with us.

IMPATIENT AMBITION.

THE ambition to achieve or attain to something beyond our personal status or even that of our ancestry or our fellows is of course laudable; the danger lies, however, in the attitude or temperament we bring to bear on the accomplishment of our ideal. It is easily apparent or should be to even a superficial observer that nine out of every ten individuals, to take a moderate estimate, wreck their prospects through impatience.

The exceptional capacity which we attribute to many of our most successful men in every sphere is to a large extent an erroneous inference, being based more or less on their standing after achievement without regard to the details of the individual career leading thereto.

We are disposed to aver that there is little difference in the ability-to-succeed feature in individuals, but a huge difference in their patience make-up, and that this latter determines the ultimate result. Impatience is everywhere apparent, in business and out of it; the impatience to be boss, to shine and to get-rich-quick.

In our own country we need not cast around very much for examples of both. Our penetentiaries furnish a record of impatience that cannot be challenged, and if need be to emphasize this, there may be cited the case of one within its walls who typically exemplified his unrighteous desires in other directions by having great trees transferred and transplanted around his domicile instead of patiently waiting for young trees to grow.

Fortunately, we can also lay claim to shining examples of the virtue of patience, and in this respect, Lord Strathcona and Senator Cox, both recently deceased, appear pre-eminent. These both attained to considerable wealth, but neither through transcendent genius or rush methods.

There is a right and a wrong way, a true and a false attitude which can be adopted to compass an ambition, and the right and true generally go under when impatience is the driver. To-day, perhaps more than ever before, patience calls for cultivation.

UNIFORMITY OF BOILER INSPECTION.

A UNIFORM standard for boiler inspection to govern the whole of Canada, long urged by the departments of the more energetic provinces in this respect, seems at last to be in sight. A conference of inspectors representing all but two provinces is at present in session in Toronto and if the earnestness and good-will of the delegates shown in the preliminary meetings be an indication of possible results, we are sure much needed reform will be accomplished.

INDUSTRIAL NOTABILITIES--No. 40

JAMES DAVIDSON, president the Thomas Davidson Mfg. Co., Ltd., manufacturers of enamelled and stamped ware, Montreal, Toronto and Winnipeg; president Brome Lake Electric Co., Waterloo, Que.; president McDonald Car Buffer Co., Ltd., Montreal; president Shefford County Conservative Association; director Shefford Agricultural Society, was born at Montreal, Sept. 25, 1854, the son of Thomas and Mary (Ritchie) Davidson, of Scotland.

He was educated in the public schools, and entered the service of Thomas Davidson & Co. when quite young, working through its various departments until he is now at the head of the enterprise.

He is owner of Ayrmount Farm, Shefford County, Que., one of the finest farms in the Province, and makes it his special hobby. Mr. Davidson is Mayor

JAMES DAVIDSON

of Waterloo, Que.; Governor of Hospital, Sweetsburg, Que.; Governor Montreal General Hospital, and Governor Western Hospital, Montreal.

He married Alice M. Goodwill, daughter of William Goodwill, May 10, 1882, and has three sons and two daughters.

His clubs are St. James, Montreal Hunt, Beaconsfield Golf, Canada, Canadian, M.A.A.A., Montreal Art Association, British Empire Club (London, England), while his recreation, as already mentioned, is farming, raising fine stock, etc.

He is a Conservative in politics and an Anglican in religion.

Mr. Davidson resides at 292 Stanley Street, Montreal.

All net ton f.o.b., Toronto.

Montreal, Que., June 22, 1914.—Though there has been little change in the volume of business handled at the present time, there is a disposition on the part of most of the supply houses to view the outlook with more favor than for some time past. Orders are none too plentiful, but several dealers report that they are figuring on contracts which will probably develop into something worth while very shortly. The Mond Nickel Co., of Coniston, Ont., have bought a lot of machinery in Montreal for installation in the new smelter.

Building work around the city is going on at a fairly satisfactory rate, both in the business districts and the residential sections. There is also a good deal of road-making under way by the civic authorities, much of it being asphalt or granite block pavement, for which a concrete base is required. This, together with private works by public utility companies, has increased the demand for concrete mixing machinery. There is not much improvement yet in railway construction work but a betterment is expected in the near future.

Metals.

There has been little change in the situation as regards metals. The market is still quiet, and inclines to weakness if anything. Little business is passing and no immediate improvement is looked for. London quotations are: Copper, spot, £61; future, £61 12 6; lead, £19 7 6; spelter, £21 7 6; iron, £51, 3.

Toronto, Ont., June 23, 1914.—Business conditions do not appear to be improving to any great extent, but there seems to be a more hopeful feeling based or continued favorable reports from the West. The crops will always be an important factor in the situation, but it does not necessarily follow that a record crop, if such materializes, will suddenly develop trade to the condition of a boom. When an improvement does begin, the process will be gradual to allow for an adjustment of conditions generally.

Industrial companies so far this year have made an exceptionally poor showing; without exception decreased profits being indicated as a result of the general depression, and the reports that are to follow do not promise to be much better. The financial stringency which became general some months ago is not now so great, but it has left in its trail a spirit of caution, which is perhaps responsible as much as anything else for the continuance of the depression. When sufficient time has elapsed to eradicate the effect of recent troubles there should be a marked improvement. Signs are not wanting that better business is anticipated this fall.

Preliminary operations in connection with the local harbor improvements are now well under way. A large number of men are being employed by the Harbor Commission and the contractors, and a considerable amount of equipment is being used. A large amount of money will be spent this year on the work. This will benefit trade locally. The North Toronto drainage scheme, involving the expenditure of over four million dollars, has been passed by the city council.

Steel Market.

There has been some disappointment expressed that the spring failed to bring about the revival in the steel trade that was looked for. There are, however, prospects of better times, and a moderate improvement may be expected in the near future. The first shipment of rails for the C.N.R. will be dispatched from Sidney, N.S., to British Columbia this week. This is part of the recent order, the balance will keep the mills going until the fall. Another sign of better times coming is the blowing in of a furnace by the Steel Company of Canada at their Hamilton, Ont., plant, last Sunday. This will be followed by a similar event next Sunday, when the company will blow in another furnace at the same plant. The company report that prospects are looking much brighter. The operation of these furnaces and mills will mean the employment of between four and five hundred men. It is considered probable that the railroads will soon have to be placing orders for equipment, as they have been out of the market for nearly twelve months.

Advices from the United States indicate that there is a buying movement in progress, but reports differ as to the extent. The railroads have been buying more freely of both rails and equipment. Prices remain at the same level, however, and no change is anticipated in the very immediate future.

Pig Iron

The pig iron market shows no improvement, but it will no doubt respond to the revival that seems to have started in the steel trade. Some regular foundrymen are moderate buyers, but such large consumers as railways and car shops, etc., are practically out of the market for the moment. The season's importations from Great Britain are much below the average.

Machine Tools.

Little can be said with regard to the machine tool market; conditions show very little variation. From general indications, no material improvement appears to be anticipated for several months. The Consumers Gas Co. have recently purchased a large planer and shaper from John Bertram & Sons Co., Dundas, Ont.

Metals.

There has been no change in prices in the local metal markets during the week. Consumers continue to buy in small lots. The outlook, however, is brighter.

Winnipeg, Man., June 20, 1914.—Geo. Harrison of the Saskatchewan Bridge & Iron Works, passed through the city this week on his way to Toronto and Chicago, to make arrangements for completing the plant which this company is now erecting in Medicine Hat. The parent plant is in Moose Jaw. A year ago the city of Medicine Hat gave this company a site of 50 acres, and the structural work on the new plant has already been completed. It will now be roofed in, and equipment purchased. When financial arrangements have been made, it

is believed that this company will be in the market for considerable machinery.

Several new propositions are under way in and out of the city, though little in the way of machine tool business is being done. The Oribo Mfg. Co., 233 Spadina Ave., Winnipeg, who recently started a plant for the manufacture of stove piping and metal garages, has secured a permit for the erection of a new factory costing $8,500. If equipment is required, it will be in the nature of sheet metal working machinery. John Brockest is president.

New Plants.

Another company building a plant in this city, who will no doubt require considerable transmission equipment, though not until September, is the Sunset Manufacturing Co., who make bags, and are connected with one of the large milling concerns. They are already at work on the foundations.

The contract for a branch factory will shortly be let by the J. R. Watkins Medical Co., Winona, Minn. This plant will be erected in Winnipeg, near the C. P. R. subway, and will cost in the neighborhood of $75,000. The building will be 100 feet square, of modern fireproof construction, and will be of sufficent strength to carry four more storeys when needed. Work will be rushed to have it completed before the arrival of cold weather.

Metals, Ltd., Calgary, have secured a permit for the erection of a warehouse on Fourth street, Edmonton. Warehouses, costing in the neighborhood of $75,000 are being erected in Winnipeg by Martin, Bole & Wynn, at the corner of McDermott and Lydia, and by Ames, Holden & McCready, at the corner of McDermott and Adelaide.

The Economy Foundry Co., who have offices at 619 Somerset Block, and a foundry at Portage la Prairie, Man., state that they are being kept very busy with jobbing work. Their usual line is manholes, gratings, and specialties of that nature. Considerable business is being done by local jobbers in threshers' supplies in view of the coming harvest. These include brass valves, injectors, steam gauges, pipe fittings, small tank pumps, sheet packing and piston packing, lubricating oils and greases, belting, etc.

Crop Reports Good.

Recent crop reports are of the most favorable character. Until a few weeks ago, Southern Saskatchewan and Alberta had had no rain, and their crop was in great danger. Business in that district as a result, was at a very low ebb. Rain has since fallen, and the rush of business expected about the time harvesting arrives is expected to eclipse that of 1912, when everybody, especially hardwaremen, were found without stocks.

The representative of a large American machinery firm, who was in the city last week, said busines looked better to him here, than anywhere in the West. He said the change was very perceptible as soon as he crossed the Rockies. He gave a gloomy description of trade conditions in Vancouver, and said that if it were not for the amount of Government work going on in British Columbia, things would be even worse.

Railway Work.

It is stated that the C.N.R. will shortly start work on the completion of its line from Calgary to MacLeod, and will erect a large roundhouse at the former city. Of the line from Calgary to Edmonton, 28 miles has already been graded, and the company intends to complete it this year if possible.

Quite a little business has been secured by a local house this week from Western blacksmiths. Many of them are buying power hammers. The Stuart Machinery Co., this week secured an order from the Winnipeg Steel Granary & Culvert Co., for a 16-foot draw bench.

Price of Nails.

Following an increase of 15c per keg in the price of nails made by Eastern manufacturers, local jobbers are considering raising the price west of the Lakes. The change, however, at this date had not been made.

PROBLEM OF COAL STORAGE.

THE problem of coal storage is an important one to every manufacturer. In order to safeguard the continuity of power supply when there is a shortage of coal due to strikes or other causes, a reserve supply of fuel must be kept. It is, however, by no means an easy matter to store coal in a satisfactoy manner, because even if means are taken to avoid the obvious forms of trouble such as spontaneous combustion, there is always—when coal is exposed to air — a slow oxidation which tends to deteriorate the calorific value of the fuel. A good deal of attention has been paid to this matter within recent times, and one or two notes on the subject may be of interest.

U.S. Bureau of Mines Investigation.

The United States Bureau of Mines recently investigated the deterioration of various kinds of coal under storage, and it was found that, while several coals evolved methane in large volumes, especially in the early period after mining the coal, the gas evolved in one year from this cause means a maximum loss in calorific value of 0.16 per cent., this loss covering a period of one year from the time the coal was mined. The Navy Department tests show a loss of less than 1 per cent. in a year on New River coal weathering in the open; and Pocahontas coal in a 120-ton pile on the Isthmus of Panama lost less than 0.4 per cent. during one year's outdoor weathering. Pittsburgh gas coal suffered no loss whatever during six months' outdoor weathering. Wyoming coal, however, lost 5.3 per cent. during two years and nine months, 3.5 per cent. of which was lost in the first three months. For a distance of from 12 to 18 in. from the surface there was bad slackening and crumbling of the lumps. Illinois coal as tested by Prof. Parr, of the University of Illinois, lost 1 to 3 per cent. in a year with slackening and crumbling.

The average value therefore appears to be a loss of 1 to 3 per cent. of heating value in one year, a large percentage of this loss occurring within from three to six months after the coal has been placed in storage.

Spontaneous Combustion Danger.

The danger which is to be most carefully avoided in connection with coal storage is the more rapid form of oxidation known as spontaneous combustion. Mr. Barker names the causes of spontaneous combustion as the escape of inflammable gases from fresh coal surfaces, the absorption of oxygen from the air with the production of heating, the presence of fine coal which brings large surfaces into contact with the air and so accelerates the oxidation of the whole mass, the presence of an excessive amount of moisture (especially if the coal under storage becomes alternately wet and dry), and in some cases the presence of external causes of heating even if these are very moderate in amount.

As regards the escape of gases, he states that the results of experiments in freshly mined coal show that the loss of gases is about equal to the volume of coal, and the heating value of such gases amounts to 0.1 or 0.2 of the heating value of the coal. The point about this is not the actual calorific value which is lost, but the danger of explosion attending on the escape of such inflammable gases; while the evolution of heat accompanying oxidation is one of the great causes of danger of spontaneous combustion in coal piles. Heat from steam pipes, boiler and walls also tend to the ignition of the mass.

The above notes give only in brief outline the general features of a problem which is of very great interest to all manufacturers, but the suggestions may form a sufficient starting point for investigations to be carried out with the object of reducing the large margin of loss and danger which at the present time exists in many coal storage schemes.—Engineering Review.

ASSOCIATION AND PERSONAL

A Weekly Record of Current Association News and of Individuals Who Have Been More or Less Prominent in Machinery Circles

G. M. Bosworth, vice-president of the C.P.R., has returned by the Alsatian from England.

R. H. Skelton, manager of the Ontario Sewer Pipe Co., Mimico, Ont., died on June 10, aged 45.

Sir Max Aitken and **H. S. Holt** have resigned from the board of the Canada Car & Foundry Co.

Alfred W. Smithers, chairman of the Grand Trunk Board, has arrived in London from Canada.

R. G. Reid, president of the Reid Newfoundland Co., has returned from abroad on the Calgarian.

Major J. A. Benyon, assistant agent-general for Quebec Province in London, died there on June 16.

Dr. Colner, formerly professor at McGill, has been appointed to the chair of engineering at London University.

Arch. Currie, city engineer of Ottawa, has returned from Atlantic City, where he has been recovering from a nervous breakdown.

Capt. H. St. George Lindsay has retired as wreck commissioner, to become superintendent of pilots for and below the Harbor of Quebec.

F. A. Skelton, secretary-treasurer of the Canadian Car and Foundry Co., Ltd., was elected a member of the board at a meeting of the directors on June 15.

Capt. T. Bourassa, deputy harbor master at Montreal, will be promoted to the full position of harbor master of that port in place of Capt. Demers.

T. E. Dalrymple, vice-president of the G. T. R., and George Smithers, of Burnett & Co., brokers, have been appointed directors of the Canada Steamship Lines.

W. D. B. Motter, Jr., who has been manager of the Canada Iron Mines, Ltd., Trenton, Ont., has been appointed manager of the Benson Mines Co., Benson Mines, N.Y.

Z. A. Hall, of the Hall Foundry Co., Hespeler, Ont., has been nominated by the Conservative convention as candidate for South Waterloo, at the approaching Provincial elections.

C. J. Brittain, manager of the Winnipeg branch of the Canadian Fairbanks-Morse Co., left hurriedly for Moose Jaw, Thursday, on receipt of news that his brother had died in that city.

Wm. C. Rowse, B.Sc., M.E, has been appointed professor of mechanical engineering at the University of Manitoba, Winnipeg. Prof. Rowse is a graduate of Purdue University.

Lieut. James F. Symons, R.N.R., who for the past year and a half has acted as assistant harbor master at Montreal, Que., is promoted to succeed Capt Bourassa, as deputy harbor master of that port.

James Frater Taylor, president Lake Superior Corporation, was in Toronto this week, doubtless with a view to getting some of the orders going for rails. The Algoma plant is doing fairly well at present.

Captain Carey, of the C.P.R. steamship lines, has retired from the service after 51 years at sea. Captain Carey was the first commander of the Empress of Ireland, but after one season relinquished the command, returning to the Lake Erie, known now as the Tyrolia.

John H. Wynne has been made manager of the Montreal Locomotive Works, Ltd., Dominion Express Building, Montreal, Que., succeeding Percy Webb, who after years of service with this and the American Locomotive Company has retired.

Professor Robert Crawford died recently at Ballyshannon, Ireland. Professor Crawford was an eminent engineer who carried out several important schemes in Canada and one time filled the chair of Engineering at McGill University, Montreal.

James G. Ross, accountant, and E. Belanger, civil engineer, both of Montreal, have been delegated by the City of Montreal, to make an examination of the plant and books of the Montreal Water & Power Co., and to submit a report to the Board of Control. This is in connection with the proposed purchase of the company's plant by the city.

G. A. McCarthy has been appointed to succeed G. W. Power as engineer of the railway and bridges section of the civic works department, Toronto. Mr. McCarthy has been at various times connected with the engineering departments of the T. & N.O.R., C.P.R., and Algoma Central Railway, while last year he was engineer on the Feather River power development in California. Mr. McCarthy will assume his duties on June 30.

George H. Flood, of St. John, N.B., who has recently been promoted as purchasing agent of the Marine and Fisheries Department, at Ottawa, was the recipient recently of an address, a gold watch and a traveling companion from his friends and colleagues at the customs house. Besides the office staff there were several captains and officers of ships of the service at the presentation, which was presided over by Captain Elkin.

Frank O. White, a Victorian of many years' experience in the shipping business has just been appointed Lloyd's agent at Victoria, B.C. He succeeds John Waterhouse, who has acted in the capacity for some time past. The agency here comes under control of C. Gardner Johnson, Vancouver, who is the British Columbian representative for the Great Britain concern. Victoria is one of Lloyd's most important stations in Canada.

M. M. Reynolds, for six years vice-president of the Grand Trunk, and later the Grand Trunk Pacific and Central Vermont Railways, passed away at an early hour on June 17, at Old Point Comfort, Virginia, from Bright's Disease. Mr. Reynold's health broke down early this spring, and on the advice of his doctors he left for Old Point Comfort about a month ago. Mr. Reynolds was born in Syracuse, N.Y., in 1859. He entered the service of the G. T. R. in 1908, as fifth vice-president, and was appointed second vice-president in 1912.

The Ideal Furniture Co., Ltd., of Vancouver, have been incorporated at Victoria, B.C., with a capital of $20,000.

The Engineers' Supply Co. have removed their offices from 139 Market St., E., to 123 Bannatyne Ave., E., Winnipeg. They carry engine packings, belting, and steam specialties.

The John Galt Engineering Co., of Calgary, have been instructed by the town of Wainwright, Sask., to prepare plans, etc., for the proposed drainage system.

The International Supply Co., of Medicine Hat has been awarded contracts amounting to $70,000 by various companies in that district for drill work and repairs.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Hespeler, Ont.—It is reported that the Canada Machinery Corporation's plant will be opened up shortly.

The Canada Wire and Cable Co., Ltd., of Toronto, has been granted permission to increase its capital to $3,000,000.

Saskatoon, Sask.—Plans are being prepared for the extension to the power house building, and are being drafted so that the proposed addition will be a complete unit, and will permit of further additions being made in the future. The addition will be built on the north side of the present building, and will be about 60 feet wide, running from the sidewalk line to the rear of the building.

St. John, N.B.—Tenders for cast iron pipes for the water and sewerage department have been opened. Bids were received from D. Y. Stewart & Co.; U.S. Cast Iron Pipe and Foundry Co.; T. McAvity & Sons, Ltd.; Vroom & Arnold, John Birch & Co., Ltd.; Canadian Fairbanks-Morse Co., Ltd.; Francis Hankin & Co.; B. & S. H. Thompson & Co., Ltd.; Drummond, McCall & Co.; Watson, Jack & Co., and Singleton, Dun & Co. The tender of John Coates & Co. was not accepted, as no deposit was enclosed.

Electrical

Salmon Arm, B.C.—A by-law will be voted on in the near future to erect electric light and power transmission lines.

Sherbrooke, Que.—The Gas and Electric Committee have been authorized to purchase six or twelve standard poles for street lighting as a test for the proposed lighting of the main streets, and also to take the necessary steps to have estimates and specifications made for the underground conduit or wiring for such lighting and to be ready to install same at the same time as the streets will be fixed up by the Road Department.

Windsor, Ont.—The city council of Windsor will ask the Ontario Hydro-Electric Commission to report on cost of construction, equipment and operation of a system of electric railways to commence at a point in the township of Sandwich West, near the town of Ojibway, and connect by one or more routes the town of Sandwich, city of Windsor, town of Walkerville, town of Ford, townships of Sandwich East and Maidstone, and villages of St. Claire and Belle River.

Simcoe, Ont.—A by-law will be voted on by the ratepayers on June 26 to authorize the raising of $40 000 for electrical equipment for the distribution of power from the Hydro-Electric Commission service.

General Industrial

Vancouver, B.C.—A creamery and ice cream plant may be established at Grand Forks.

Danville, Que.—J. L. Goodhue & Co. are enlarging their plant at the tannery by adding to the buildings already erected.

Lockwood, Sask.—The elevator of the Maple Leaf Elevator Co. has been destroyed by fire. The loss is estimated at $7,000.

Windsor, Ont.—A by-law will be voted on to grant a site to Salzenstein Bros., who propose to build an abattoir. J. C. Pennington, Windsor, architect.

Lachute, Que.—The Lachute Knitting Co. will immediately commence rebuilding their plant which was recently destroyed by fire.

St. John, N.B.—The Board of Trade has received inquiries from a brick-making firm regarding opportunities for the establishment of a brick-making plant here. The firm state that they would employ 500 men to start and they have already had the offer of free sites in two Canadian cities. They ask what facilities over and above those of manufacture could be obtained here. The letter has been referred to the council for consultation with the civic authorities.

Ottawa, Ont. — A new million-dollar transfer elevator will be built in Vancouver by the Dominion Government. The elevator is to be built on a site situated on the Government dock in Vancouver harbor. It will furnish a facility much needed by the Pacific coast, but especially valuable in view of the opening of the Panama Canal. Tenders will be called for the structure within a couple of months. It is expected the cost of the elevator will be between $750,000 and $1,000,000.

Municipal

St. John, N.B.—The council are considering the question of installing an incinerator.

Ottawa, Ont.—The town council of Gatineau Point are considering the purchase of a fire engine.

Montreal, Que.—The Board of Control have approved of an expenditure of $13,900 for new water mains.

St. John, N.B.—The city council has authorized the purchase of a motor truck for the works department at a cost of $5,000.

Brandon, Man.—The Brandon Gas & Power Co. will be in the market later on in the season for cast iron pipe for gas mains.

Tillsonburg, Ont.—A by-law will be voted on by the ratepayers on June 26 in connection with the Oxford Linen Mills.

Campbellford, Ont.—At a recent meeting of the Water and Light Commission it was decided to purchase an additional 500 feet of hose for fire protection purposes.

Pembroke, Ont.—Plans are in progress for extensions to the waterworks system. The town council will receive prices on cast iron pipe, specials, hydrants and valves.

St. John, N.B.—The council have decided to purchase a motor-driven aerial truck or motor pumping engine for the fire department. The estimated cost is $12,000.

Vancouver, B C.—Contracts for brass goods have been recommended to be let to the Mueller Co.: for hydrants to the Terminal City Iron Works; for valves to the Crane Co.: for meters to the Buffalo Meter Co.

Ottawa, Ont.—The city council has decided to purchase an asphalt surface heater, fire wagons, tar pots, dampers, also a drain-cleaning apparatus for the works department. Tenders will be called shortly.

Sherbrooke, Que.—A request by the Gas and Electric Department for an extra appropriation of $16,000 for the purchase of 2,000 electric meters to replace the controllers has been referred to the Finance Committee.

The Ford-Smith Machine Company

Pulley may be covered over with a Special Cap and Machine driven from below if desired.

20-in. Heavy Type, Self-Oiling Polisher

High-Grade Polishing Machines

We build the type shown here in sizes for 16″ and 20″ wheels, and a lighter type for wheels from 6″ up to 18″, also self-oiling.

Besides these we manufacture **Double Spindle Machines**, Overhung Machines, etc., and can supply any of above belt or direct motor drive. **You ought to have our latest catalog and further get acquainted with Ford-Smith service, both in regard to delivery and quality machines.**

WE MANUFACTURE MOST EVERYTHING IN THE GRINDER LINE.

The Ford-Smith Machine Co., - Hamilton, Ontario

Heat and Friction will be killed and all Ball-Bearing Troubles reduced to a minimum if you use these

Asbestos Lubricants

That you'll save much money through their use is a certainty!

Giving us the opportunity of putting you in touch with users is the first step toward greater economy.

Write for list of users now.

The Railway Asbestos Packing Co., Ltd.

Home Office and Factory: Sherbrooke, P.Q.

Montreal Office: 30 St. Francois Xavier St.

ASBESTOLENE

A lubricant that is manufactured specially to meet the growing demand for a high-grade friction-eliminating substance, one that prevents heat due to friction, and reduces that friction itself to the minimum.

AXOLENE

Is the most economical grease. Where there is a demand for a heavier-bodied lubricant, this meets the requirements perfectly. It does not become hardened with age, it is not affected by atmospheric changes. It meets with general favor as a lubricant where slower speeds are to be encountered.

SPEDOLENE

Designed especially for use in connection with Transmissions, Differentials, Universal Joints, Bearings, and all worn gears in Motor Cars or Trucks. Where rapidly moving parts are to be satisfactorily lubricated, this cannot be equalled.

Sherbrooke, Que.—The Gas and Electric Department have been authorized to engage a consulting engineer to prepare plans and specifications jointly with the city engineer for the construction of a concrete dam at the city's electric plant on the Magog River.

Orillia, Ont.—The by-law which was voted on last Thursday for the raising of $85,000 to install a filtration plant passed by a majority of 66. The ratepayers also voted to install a water main in the Moffatt Farm and also to protect that district and Cedar Island from fire. Over 600 ratepayers turned out to the polls, 259 of whom voted against the by-laws.

Vernon, B.C.—A letter from the Provincial Board of Health has been received by the city engineers, with reference to the proposed changes and additions to the city's sewage disposal works, which requires the city to construct at once a chlorination tank in which the present outflow can be treated during the time that the permanent plant is being erected. The tank will cost about $620.

Vernon, B.C.—Plans and specifications for the complete new disposal works were recently submitted to the City Council by Cummins and Agnew, and were referred to the Health Committee for approval. After being approved by the council, the plans will have to be sent to Victoria to obtain the sanction of the Provincial health department before the construction work can be begun.

Building Notes

Toronto, Ont.—Charles Tugman will erect a $40,000 building at 288 and 290 Yonge Street.

Oakville, Ont—A post office and armory will probably be built here at an estimated cost of $40,000.

Camrose, Alta. — The Imperial Oil Co., will build a warehouse here. Jas. A. Boyd, of Edmonton, is the district manager for the company.

London, Ont.—It is reported that the International Harvester Co. is considering the purchase of a site for a larger warehouse and assembling plant in this city.

Toronto, Ont.—S. Rosenblat has plans out for a four-storey warehouse which he intends to build on the property he purchased about a year ago in McCaul street. The cost will run about $35,000.

Prince Rupert, B.C.—Tenders are being called until July 6 for the erection of a post office at an estimated cost of $100,000. R. C. Desrochers, secretary, Department of Public Works, Ottawa.

Hamilton, Ont.—The proposed extensions to the General Hospital will cost about $100,000. The plans have been prepared.

Ingersoll Ont. — An armory will be erected here at a cost of $50,000. Tenders will be called shortly.

Montreal, Que.—Tenders for the erection of the $100,000 factory for the Tuckett Tobacco Co. are being called. The architects are Stewart & Witton, Hamilton, and Brown & Vallance, Montreal.

Redcliff, Alta.—The burgesses have voted unanimously in favor of the $15,000 by-law providing for the enlargement of the town hall and the building of a new fire hall. It is hoped to get this work started as soon as possible.

Toronto, Ont.—A permit has been issued from the City Architect's Department for a $100,000 six-storey warehouse to be built on the north-west corner of Yonge and Albert streets for the Misses M. E. and M. McCarthy.

Toronto, Ont.—The Board of Control has granted to the Scotland Woolen Mills Co., a permit for a four-storey building to be erected on Simcoe street near Queen. The new building will consist of a warehouse and factory.

Toronto, Ont.—A six-storey warehouse will be erected at 256-260 Richmond street, west, by David Dunkelman. The building will be of steel, brick and stone and will cost $55,000. A building permit was issued by the city architect's department on June 11.

Regina, Sask.—An application for a permit for the new Woolworth store on Eleventh avenue, has been made at the building inspector's office. The building is to be completed in six weeks' time at a cost of $12,000 by Thos. Barnard, who has been awarded the contract. The completed building will occupy a space 50 by 100 feet with 50 foot frontage, and be three storeys high.

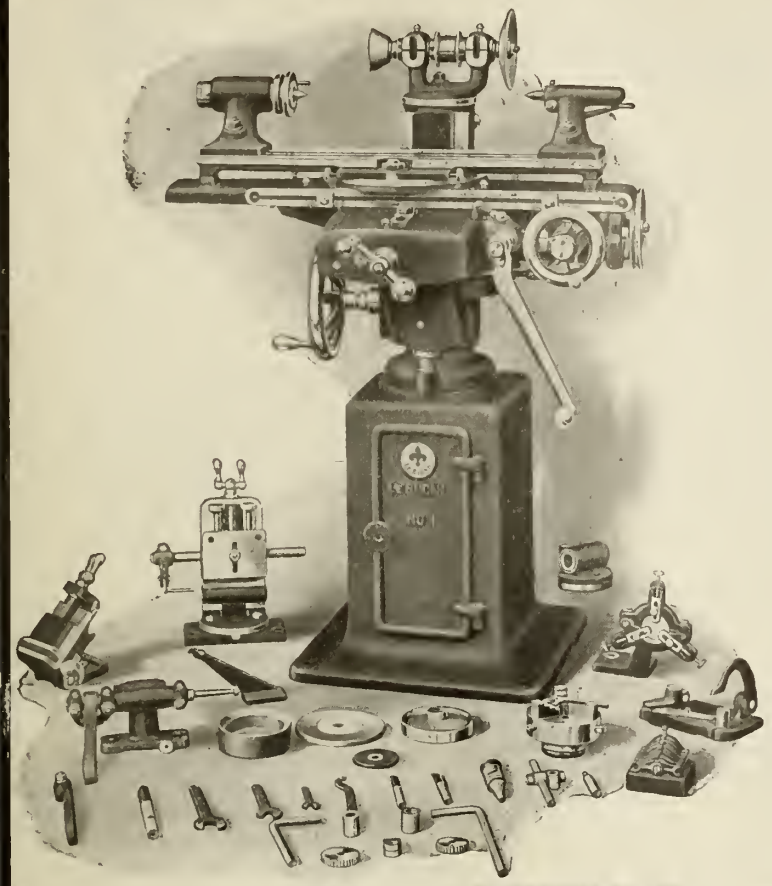
Ottawa, Ont.—Tenders are being called for a public building at Palmerston, Ont. Plans, specifications and form of contract can be seen and forms of tender obtained at the office of Mr. Thos. Hastings, Clerk of Works, Postal Station "F," Yonge Street, Toronto, Ont., the postmaster, Palmerston, Ont., and at the Department of Public Works, Ottawa.

Ottawa, Ont.—Tenders will be received up to Monday, July 13, for the erection of postal station "E" at Toronto, Ont. Plans, specifications and form of contract can be seen and forms of tender obtained at the office of Thos. A. Hastings, Clerk of Works, Postal Station "F," Yonge Street, Toronto, Ont., and at the Department of Public Works, Ottawa.

Toronto, Ont.—A new large five-storey building is to be erected at Nos. 176 to 180 John Street, just a little north of Queen Street, by the F. S. Thomas Co., bookbinders. The cost of the site and building will be about $160,000, the land having been purchased some time ago for about $30,000. The dimensions of the site are 30 feet by 110 feet, and it is the intention of the company to occupy a portion of the new building and let the balance. S. L. Yolles is the architect

Toronto, Ont.—The contract has been let and construction work will begin almost immediately on a new branch bank building to be erected at the south-west corner of McCaul and St. Patrick streets. The structure will cost about $30,000. The site for the building was purchased some time ago at $800 a foot, and consists of about 40 feet frontage on St. Patrick street by a depth of about 100 feet on McCaul street. The total outlay for land and building is, therefore, over $50,000.

Toronto, Ont.—A. A. Barthelmes and Frederick Courtemanche, of Toronto, have purchased the southwest corner of Teraulay and Albert streets and will erect a ten-storey office building to cost in the neighborhood of $300,000. The new structure will be the latest word in office building construction, and will be of steel and brick construction and possibly have a white terra cotta exterior. The property, which is now vacant, has 50 feet frontage on Teraulay street and 164 feet frontage on Albert street. The land assessment amounts to $25,000. It is likely that the new skyscraper will be tenanted almost wholly by law firms, for which it is admirably situated.



Wood Working

Huntsville, Ont.—The Muskoka Wood Manufacturing Co. will rebuild their saw mill.

Montreal, Que.—A fire on June 16, destroyed the sash and door factory of Jasmin and Cantin. The loss on the building, machinery and contents is estimated at $20,000, on which there is $5,000 insurance.

Montreal, Que.—Fire in the saw mill and sash and door factory of Paul Beaudry, 637 Davidson street, on June 11 did damage to the extent of about $60,000. Thousands of feet of sawn lumber were destroyed.

Nelson, B.C. — By agreement with Forest Mills Co. of British Columbia, J. S. Deschamps of Rossland, will shortly commence construction at Nelson of a

big lumber mill on the site owned by Forest Mills.

Ottawa, Ont.— Mr. Ritchie, whose mill was recently burnt in Aylmer, has begun plans for the rebuilding. It is reported that he has bought the machinery and equipment of McKay's mill, which is farther up in the country. This equipment will be removed to Aylmer and installed in the new mill.

Contracts Awarded

Regina, Sask.—The contract has been awarded to R. D. Wood & Co. for 77 fire hydrants at a total cost of $3,383.38; and to Jenkins Bros., Ltd., for gate valves at a total cost of $3,383.57.

Stratford, Ont.—A contract has been awarded to the Canadian Allis-Chalmers, Ltd., for the supply of two new boilers to be installed at the civic pumping station.

Ottawa, Ont.—The Government has awarded to Marois and Girard the contract for a new public building at Jonqueres, Que. The cost will be $20,850.

Shawinigan Falls, Que.—The contract for the foundations for the extensions to the paper mill of the Belgo-Canadian Pulp and Paper Co. has been let to Raymond Concrete Pile Co., of Montreal.

Victoria, B.C.—The contract has been awarded by the board of directors of the Royal Jubilee Hospital to the British Columbia Construction and Engineering Co., Victoria, B.C., for the erection of a laundry and power house to cost $27,575.

Swift Current, Sask.—The following contracts have been awarded by the town council: Mannesmann Tube Co., of Montreal, for cast iron and steel pipe with specials, at $7,566.75; Ressenlaer Valve Co., of Troy, N.Y., for hydrants, gate valves and boxes, at $1,741.25.

Transcona, Man.—The following contracts have been awarded by the town council: Canada Iron Corporation, Montreal, cast iron pipes; J. S. Neilson Co., Winnipeg, hydrants; McAvity & Sons, St. John, N.B., valves and valve boxes; Economy Foundry Co., Winnipeg, sewer castings.

Regina, Sask.—The Regina Plate Glass Co. has been awarded the contract for the plate glass which will be used at the new powerhouse. Over 5,000 square feet of wire glass will be used in the building, making one full carload. The glass will all be of British manufacture and will be in the city by the end of August.

Owen Sound, Ont. — The Provincial Hydro-Electric Commission have awarded contracts for two dams at Eugenia Falls, to the Ambursen Hydraulic Construction Co., of Montreal, and to Hyland, Scribbin & White, of Toronto. The contracts involve an expenditure of $230,000. Tenders are being called for hydraulic and electrical equipment capable of developing 4,000 h.p. The ultimate development will be 8,000 h.p.

Montreal, Que.—The contract has been awarded by the city of Montreal to W. E. Seagrave & Co. for the supply of auto fire apparatus as follows: One automobile salvage wagon; two automobile tractors, 60-h.p.; two automobile tractors, 80-h.p.; two hose wagons; one 85-ft. aerial ladder auto truck; one automobile fire engine of a capacity of 1,200 American gallons. The total amount of the contract is $81,300.

Tottenham, Ont.—The following contracts in connection with the waterworks system have been awarded by the Municipal Council. Water tank, Hunter Bridge and Boiler Co., of Kincardine; water pipes and specials, Page-Hersey Iron, Tube and Lead Co., Ltd., of Toronto; hydrants, Darling Pump and Mfg. Co., of Williamsport, Pa.; valves, London Foundry Co., of London; laying pipe, E. J. Hartnett, of Toronto; storage basin, Lewis Construction Co., of Toronto.

Montreal, Que.—The Cedar Rapids Manufacturing & Power Co. has just let a contract to Simpson Brothers, of Montreal, for dredging work. This work consists in the removal of the barrier at the head of the canal and dredging out the forebay immediately above the intake. There is involved the removal of about 175,000 yards of material, and the work is to be completed before the end of the year. Water will be admitted to the canal on November 1, and from that date the dredging will continue until completed.

Tenders

South Vancouver, B.C.—Tenders will be received for one "Marion" steam shovel, sets of rails and dump wagons. Plans and specifications may be obtained from Jas. B. Springford, South Vancouver, B.C.

Schomberg, Ont.—Tenders for the construction of two bridges in King Township will be opened at the meeting of the Township Council on June 27. The bridges are located at Cold Creek and Kettleby, and will cost about $1,600 each. They will be of reinforced concrete construction.

Winnipeg, Man.—Tenders will be received up to Tuesday, June 30, 1914, for the supply of cast iron water pipe and specials for the domestic water-works system. Specification and form of tender may be obtained at the office of the city engineer, 223 James Avenue, Winnipeg. M. Peterson, secretary Board of Control.

Winnipeg, Man.—Tenders will be received up to Tuesday, June 30th, 1914, for the supply of 150 6-inch hydrants for the domestic water works system. Specification and form of tender may be obtained at the office of the City Engineer, 223 James Avenue, Winnipeg. M. Peterson, Secretary, Board of Control.

Ottawa, Ont.—Tenders will be received up to Tuesday, July 14, for the construction of substructure and approaches for a bridge at Hawkesbury, Ont. Plans, specifications and form of contract can be seen at this department and at the offices of the district engineers, Shaughnessy Building, Montreal, P.Q.; Confederation Life Building, Toronto, Ont., and on application to the postmaster at Hawkesbury, Ont. R. C. Desrochers, secretary, Department of Public Works, Ottawa.

Toronto, Ont—Tenders will be received up to Tuesday, July 14, 1914, for the supply and delivery of one or two five-ton electrical chasses, equipped with steel-riveted tanks of 1,200 Imperial gallons capacity, together with sprinkling and flushing apparatus complete, for the city of Toronto. Conditions of tendering may be seen, and tender form obtained, together with all information relative thereto, at the offices of the Department of Street Cleaning, City Hall, Toronto.

Refrigeration

Regina, Sask.—A. Harrison, of Minneapolis, will build a $50,000 ice plant here. Building operations will commence shortly.

Calgary, Alta.—The ice factory being erected by the Crystal Ice Co., is to be of 50 tons daily capacity with "Arctic-Pownall" raw water ice-making system.

New Westminster, B.C.—The Columbia Cold Storage Co., are moving their plant to Steveston, B.C. Farrell & Fregent are the owners and George Cassidy is in charge of the new plant.

Vancouver, B.C.—The Vancouver & Prince Rupert Meat Co., it is reported, have made arrangements for building a cold storage warehouse and refrigerating plant at 71 Water Street, Vancouver.

Toronto, Ont.—The Lake Simcoe Ice Supply Co., T. G. Rogers, secretary, who have hitherto dealt only in natural ice, are asking tenders on a 100-ton ice

The night watchman takes a snooze

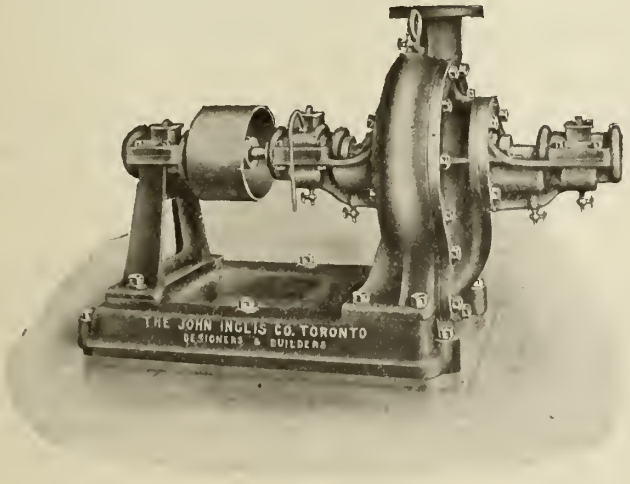
And in the meantime the building catches fire, which gets beyond control if it is not Sprinkler protected.

By installing

Manufacturers' Automatic Sprinklers

You will have wide-awake watchmen and firemen on the job, night and day. You will be making it practically impossible for your Plant to burn. You get your insurance rates reduced about 80%—and after five years you get the protection for nothing, as our Sprinklers will pay for themselves in that time, if not sooner.

Let us give you estimates on equipping your old or new Plant.



Write us now.

The advertiser would like to know where you saw his advertisement—tell him.

manufacturing plant to be erected in the fall.

Vancouver, B.C.—The Schushartie Bay Ice Co., who are building an ice factory at the north end of Vancouver Island, B.C., have let the contract for a 12-ton ammonia compression machine to the Armstrong Machinery Co., Spokane, Wash.

New Westminster, B. C. — The total cost of the new building and plant for the St. Mungo Cold Storage Co., will be about $40,000. The building will be 132 x 75 feet, two storeys high. James Anderson is the manager and William Hayman of Sapperton is the contractor.

Montreal, Que.—The Montreal Arena has made application to the Westmount City Council for permission to establish an ice manufacturing plant on the lot adjoining the Arena, and fronting on St. Catherine street and Western avenues. The present intention is to operate the plant only in winter for the purpose of insuring a perfect sheet of ice for the hockey season, but it will be available for manufacturing ice for commercial uses should it be decided to enter this field. The plant will have a capacity of 100 tons refrigeration per day. No opposition to the installation is expected, and as soon as the permit is secured the work will be begun and completed before winter.

Saskatoon, Sask.—Within two weeks representatives of the Saskatchewan Co-operative Abattoir and Cold Storage Association, the Rural Municipalities Association, the Grain Growers' Association and the Live Stock Association will wait upon the members of the Provincial Government and ask them to formulate a policy as to how best to establish a large and up-to-date packing plant at some central point in the province, to be co-operatively owned and operated. Hon. W. C. Sutherland states that an English syndicate, which had $15,000,000 available now for investment in the West, proposed to divide it up, spending $5,000,000 in each province and that if the Provincial Government would guarantee the bonds of the abattoir the company would purchase them and finance the scheme, if necessary, to the extent of $5,000,000.

Railways—Bridges

St. Catharines, Ont. — The Grand Trunk station at Thorold, was destroyed by fire on June 10, at an approximate loss of $10,000, partially insured. The cause of the fire is unknown.

Lamlash, Ont.—Tenders will be received by Geo. Brown, Lamlash, until June 30, for the erection of a steel bridge over a branch of the Saugeen River, 42 ft. span. Jas. Warren, engineer, Walkerton, Ont.

Calgary, Alta.—Tenders are called for construction of a four-span concrete and structural steel bridge, 20 feet wide, carrying one steel railway track. The estimated cost is $90,000. Engineer, Geo. W. Craig.

T. & N. O. Railroad.—The first solid steel train to be operated in Canada by a Canadian road, arrived in Toronto on June 18, from Chicago. The Pullman Company turned out this six-coach steel train, including baggage car, for the T. & N. O. road, at a cost of $140,000. Another steel train is under completion in Chicago, and will be turned out shortly.

Vancouver, B.C. — C.P.R. engineers and surveyors left Campbell River, B.C., recently in two parties working on the preparation of surveys to carry the line of the Esquimalt and Nanaimo Railway northward along the shore of Vancouver Island. One survey party is working south of Campbell River, and one north, the latter proceeding along the trail built by the government into the Salmon River Valley. It is stated that the intention of the C.P.R. is to build eventually to the north end of Vancouver Island.

Trade Gossip

W. D. Beath & Son, Ltd., Toronto, have been awarded a contract for three 7-ton stiff leg derricks with 50-ft booms for operating grab buckets on the Trent Valley Canal at Ragged Rapids, Ont.

Haywood & Dods, Ltd., of Victoria, B.C., have been awarded a contract by the Dominion Government for the installation of a heating and ventilating system in a public building at Victoria, B.C.

The A. & P Steven Co., Glasgow, Scotland, have been awarded a contract by the Toronto, Ont., Board of Works for the supply and installation of an electric elevator for the City Hall at a cost of $4,300.

Grimsby, Ont.—Fire on June 18, broke out at the plant of the Consumers' Lumber & Box Co., doing damage to the extent of $25,000. The place was practically burned to the ground, and over $7,000 worth of new machinery, installed within the past few days, was destroyed. Insurance amounts to $12,000.

The Storey Pump & Equipment Co., Kent Bldg., Toronto, Ont., of which M. E. Storey is manager, have secured the agency for the Ontario district of the International Steam Pump Co., which comprises the following associated companies:—Blake-Knowles Steam Pump Works, Snow Steam Pump Works, Deane Steam Pump Co., and Henry R. Worthington.

Canada Machinery Corporation, Galt, Ont.—In connection with the new financing recently carried out by this company whereby $150,000, additional working capital was provided by the shareholders, certain changes in the management have taken place through the retirement of T. F. Kenny as general manager. T. H. Watson, the newly elected president, will in future assume that position, and take an active part in directing the company's affairs.

The Smart Turner Machine Co., Hamilton, Ont., recently received orders for the following equipment:—Barfelt & Co., London, Ont., one vertical centrifugal pump; the Coniagas Reduction Co., Thorold, Ont., one centrifugal pump; the London Cold Storage & Warehouse Co., London, Ont., one duplex pump; the Canada Glue Co., Brantford, Ont., one duplex pump; the Imperial Oil Co., Sarnia, Ont., one vertical triplex pump.

The Turbine Equipment Co., Ltd., Toronto, have secured a contract from the Brantford Corporation for the new pumping plant. Two of these pumps will be De Laval 12-in. multi-stage, each direct connected to a 250 h.p. Canadian Westinghouse synchronous motor. The output of each unit will be four million Imperial gallons per day against 200 ft. head. The company are also supplying two booster pumps which will be of the De Laval steam turbine driven single-stage double suction type. High speed turbines will be used so as to obtain a maximum of economy, and De Laval double helical reduction gears will be fitted to reduce the pump speed to 1,800 r.p.m. The output of each unit will be four million Imperial gallons per day against 100 ft. head, and in case the electrical power is out of commission, these two pumps will be arranged to run in series. In case of fire either booster pump can run in series with either electrically driven domestic pump.

New Incorporations

The Grimsby Specialty Co., Ltd., has been incorporated at Toronto, with a capital of $50,000, to carry on business as soap manufacturers at Grimsby, Ont. Incorporators—C. W. Livingston, A. C. McNaughton and V. H. Johnston, of Toronto.

The Harvey National Supply & Mfg. Co., Ltd., has been incorporated at Toronto, with a capital of $50,000, to manufacture automobile kitchenettes and stoves at Toronto. Incorporators—J. M. Harvey, W. W. Stoddart, and E. McFadden, all of Toronto.

Marine

Port Credit, Ont.—The Dominion Government have made a grant of $50,000 for harbor improvements here.

St. Catharines, Ont.—On June 10, the steamer "Pueblo," owned by the Canada Cement Co., on entering lock No. 9, of the Welland canal, struck the gates, with the result that six gates were washed away and navigation tied up for four days.

The Great Lakes and Atlantic Canal and Power Co., Ltd., has been incorporated at Ottawa, with a capital of $250,000, to carry on business as marine surveyors at Montreal. Incorporators—E. A. Morgan, G. A. Morrison, and H. Stanislaus, of Montreal.

Collingwood, Ont.—Amongst the new companies recently incorporated appears the name of the Georgian Bay Navigation Co., of Owen Sound, with a capital of $40,000. This is the company that bought Captain Cleland's boat, the S. S. Soo City.

Sarnia, Ont.—According to report, the Reid Wrecking Co., will establish a coaling station at Point Aux Barques with the coal they are taking from the steamer Hanna, aground at Point Aux Barques since the big storm of November last year. The Hanna has over 10,000 tons of coal aboard.

South Vancouver, B.C.—The Dominion Government has appropriated $10,000 for two wharves, one to be built here and the other at Eburne, the grant being provisional upon the donation of sites by the municipalities of Point Grey and Eburne, according to a report made public by Mr. W. J. Prowse at a meeting of the Main Street Improvement Association on May 26.

St. Catharines, Ont.—The big dredge Delver, valued at $100,000, owned by the Dominion Dredging Co., contractors for No. 1 section Welland ship canal, capsized and sank on June 14 in a gale, while the tug Alice, of Port Dalhousie was endeavoring to take it into the harbor from Port Weller, where she had been engaged with other dredges in making a harbor for the new ship canal.

Quebec, Que.—A new dredge just out of the builders' hands arrived here on June 12, having crossed the Atlantic under her own steam. She is of the bucket pattern and capable of removing 1,000 tons of material an hour. The buckets have not yet been fitted, but as soon as this is done she will be able to commence operations and thus push forward the improvements now in progress at this port.

CLASSIFIED ADVERTISEMENTS

¶ Those who wish to sell or buy a business, obtain competent help, connect with satisfactory positions, or secure aid in starting new enterprises should not fail to use the Want Ad. Page of "CANADIAN MACHINERY."

¶ If you want to sell or buy a second-hand lathe, planer or any other shop equipment, let "CANADIAN MACHINERY" pick out a seller or buyer for you. How about that second-hand engine or boiler which you would like to dispose of?

¶ "CANADIAN MACHINERY" is the central market place of the machinery trades throughout Canada.

¶ There is always some one looking for just such a proposition as you have to offer.

Keep in mind the dominant fact that mankind from its first appearance on the earth has been schooled by nature to look for signs; for invitations to taste; for suggestions as to what to wear. Tell your story briefly, forcibly, truthfully, and address it through the proper media and you can successfully apply advertising as a means to increased distribution.

White Rock, B.C. — The Dominion Government has appropriated $5,000 for building a wharf here. Work will begin at once.

Captain L. A. Demers has resigned his position as harbormaster of the Port of Montreal, and has been appointed wreck commissioner.

Point Grey, B.C.—Harbor Commissioner Hodgson states that the Dominion Government have made a grant of $10,000 to the North Fraser Harbor Commissioners for the purpose of constructing wharfs at both Eburne and South Vancouver. These wharfs, so Mr. Hodgson intimated, would be constructed by the commissioners just as soon as the municipalities affected would designate and supply the sites.

Victoria, B.C.—With a view to making an immediate start in the construction of the reinforced concrete cribs that will be a feature of the two ocean piers to be erected at Ogden Point, Grant, Smith & McDonnell, the contractors, are now engaged in overhauling and assembling the plant and material alongside the big floating drydock in readiness for the preliminary operations. Two concrete cribs of approximately 3,500 tons each in weight will be built simultaneously on the drydock, and the first of these huge caissons will be put together aboard the craft at the point where she is now moored in the Inner Harbor.

Sault Ste. Marie, Ont.—The first important vessel deal of the year was closed on May 26, when E. D. Carter, of Erie, sold the steel steamer E. D. Carter to the Algoma Central Steamship Line, of Sault Ste. Marie, Ont. The price was not given out. The Carter has a capacity of about 9,000 tons, and was built in Wyandotte in 1908. She is of arch construction, with side tanks, and is 524 feet over all, 504 feet keel, 54 ft. beam, and 30 ft. deep, with gross tonnage of 6,359. The Algoma Steamship Co. has been in the market for steel ships of this size for several months, but until recently had been unable to get a price that would meet their views.

Toronto, Ont.—Another lake merger which it is expected will be consummated in a few days, is under way in which the Farrar Transportation Co., Ltd., grain and general forwarders, Collingwood, are involved. The new company, to be known as the Gulf & Lake Navigation Co., is being organized to operate about sixteen steamers. It is understood that Mr. J. W. Norcross, managing director of Canada Steamship Lines, and some American vessel interests are putting through the deal. Mr. Norcross admitted that while such a move was on foot, the new company would not have connection with the Canadian Steamship Lines directly or indirectly.

New Incorporations

The Cumshewa Iron Mines, Ltd., have been incorporated at Victoria, B.C., with a capital of $100,000. Head office at Victoria.

HAWKINS LIBRARY OF ELECTRICITY

In 6 Leather Pocket Books Price per $1 Volume

Here is a set of books that no man in the ELECTRICAL FIELD should do without. This is the ELECTRICAL AGE in which we live; ELECTRICITY now controls more trades, directs more men, offers more opportunities than any other power that man has yet discovered. Do you wish to know the underlying principles of MODERN ELECTRICAL PRACTICE?

If so, **HAWKINS ELECTRICAL GUIDES** will give you the information. In reality they are a school within themselves, containing a complete study course with QUESTIONS, ANSWERS AND ILLUSTRATIONS, written in plain everyday language so that a practical man can understand the "HOW, WHEN AND WHY" OF ELECTRICITY.

"THAT'S JUST WHAT I NEED"

Read over the titles shown on the back of each volume, and note the scope of each book. They are handsomely bound in flexible black leather with gold edges and will readily go in the pocket. THEY ARE NOT ONLY THE BEST, BUT THE CHEAPEST WORKS PUBLISHED ON ELECTRICITY.

Each book is complete in itself and will be supplied $1.00 per copy, but we believe that the complete set is the best bargain.

The books can speak for themselves and a careful examination, page by page, and illustration by illustration, will convince you of their big value.

If you will fill out the following coupon giving all the information requested, WE WILL SUBMIT THE SIX VOLUMES FOR EXAMINATION ON CONDITIONS NAMED.

FREE EXAMINATION OFFER

Reading Brimful of Interest for Busy Canadians

The July MacLean's, just off the press, is full of feature articles and stories which should appeal to every Canadian. Does not this list interest you?

"The Education of the Camp"—A strong article by a military authority on the benefits, physical and otherwise, of militia training.

"On the Firing Line in Riel's Day"—The first of a series of articles on the North-west Rebellion, written by one who served through the last campaign. These stories will be full of reminiscences given to the public for the first time.

"The Adventures of Madelyn Mack: Detective"—The best detective stories published since Sherlock Holmes first appeared. The first of this series appears under the title "The Man With Nine Lives"—A strong recital of adventure, written in graphic, vivid style.

"The Miracle of the X-Rays"—A clear presentation of one of the greatest discoveries of modern times. The fascination that science exerts on the lay mind will serve to make this article one of absorbing interest to all.

There is nothing a man could not do if he had the right information before starting at it. Under the heading: "Getting the Facts," a Lieutenant of Harrington Emerson, the chief exponent of efficiency, tells how the right information can always be obtained. Want to get started on the highroad to success? Read this article.

Glen Campbell—Broncho buster, sturdy man of the plains, orator, player of practical jokes, firm friend and hard fighter—is the subject of a breezy sketch that will both interest and amuse. Meet this famous Western M.P. in the pages of July MacLean's.

These are just a few. There are plenty more of the same kind to be found in the July issue of Canada's national magazine. If you don't read MacLean's, start with the July number.

Send a postcard and have your name added to our subscription list. You'll be delighted with every issue.

Subscription price $2.00 *per year.* 20 *cents a copy.*

143-149 University Avenue, Toronto, Canada

laundry proprietors at Hamilton, Ont. Incorporators:—E. L. Middleton, T. L. Monahan, and F. Morrow, all of Toronto.

The Alexander Hamilton Institute has been licensed at Toronto with a capital of $25,000 to print and publish books, magazines, etc., at Toronto, Ont. The corporation has appointed L. Le Roy Fleck, of Toronto, to be its attorney.

The Canadian-Detroit Steel Products, Ltd., has been incorporated at Toronto with a capital of $40,000 to deal in iron, steel, and other metal products at Windsor, Ont. Incorporators:—H. C. Bulkley, S. K. Pittman, and J. G. Rumney, all of Detroit.

Catalogues

Motor Generator Sets.—The Lincoln Electric Co., Cleveland, Ohio, have issued a bulletin descriptive of the "Lincoln" motor generator sets for automobile battery charging and other transforming purposes. Full particulars are given of these sets with illustrations, showing their general arrangement.

Electric Hoists.—The Detroit Hoist & Machine Co., Detroit, Mich., have sent us a catalogue dealing with the portable and mono-rail types of electric hoists which they make. The catalogue is fully illustrated showing the various types of hoist accompanied by a brief description of each with principal dimensions and prices.

Starting Switches, self-acting type for a.c. motors are dealt with at length in pamphlet No. 611, recently issued by the Igranic Electric Co., Ltd., London, England. Several applications of the "Igranic" starting switches for push button, remote, pressure or float control are described and accompanied by illustrations.

The Elliott Company, Pittsburgh, Pa., have published Bulletin No. 89, which has as its subject "How to Take Oil Out of Boiler Feed Water." The bulletin deals with the "Elliott" grease extractors applied to pumping stations, and covers the subject in a comprehensive manner. An illustration is included showing the "Elliott" twin filter and grease extractor.

Overhead Traveling Cranes. — The Herbert Morris Crane & Hoist Co., Toronto, are distributing bulletin B6, dealing with type "G" overhead traveling cranes. The bulletin contains illustrations of several important installations, one showing a 30-ton capacity crane in position. A diagram is included with table giving the principal dimensions, working load and spans for the various sizes.

McLain's System.—A folder is being distributed by McLain's System, Milwaukee, Wis., setting forth a few claims made by the company for their system for reducing losses in the foundry. A post card is attached so that any interested reader desiring full information can mail same to the company who will send literature free of charge.

Electric Hoists and their application is the subject of bulletin 301A being distributed by the Pawling & Harnischfeger Co., Milwaukee, Wis. The bulletin deals, as the title indicates, with electric hoist installations and contains a brief description of a number of these. The illustrations show the wide application of these hoists and their general utility.

Air Compressors and Vacuum Pumps.—The Mesta Machine Co., Pittsburgh, Pa., have sent us a copy of Bulletin N., devoted to a description of the air compressors and vacuum pumps which they make. The bulletin contains a description of the principal features embodied in the design of the above equipment. Included with the illustrations are reproductions of indicator cards and a volumetric efficiency diagram.

Hoisting Machinery, is the subject of a catalogue recently issued by the Detroit Hoist & Machine Co., Detroit, Mich. The products dealt with in this catalogue include pneumatic and electric-geared hoists, locomotive turntable tractors and other portable hoisting appliances. Illustrations are given covering the various types accompanied by brief descriptions and tables giving the capacities and principal dimensions.

Boring Mills.—"The Driving Box Special" of the Gisholt lines is the title of a bulletin B.M.F.—1 dealing with the 42-in. boring mill made by the Gisholt Machine Co., Madison, Wis. The bulletin contains some interesting information on machining locomotive driving boxes, together with the results of a time test made on a "Gisholt" mill. Among the illustrations are two views showing the method of setting an axle box on the boring mill and the relative position of the boring tool.

Wagon and Truck Loaders made by the Link-Belt Co., Philadelphia, Pa., are described in catalogue No. 190, which we have received. The Link-Belt portable wagon and truck loaders dealt with in this catalogue are designed for loading loose materials, such as coal, sand and gravel, and their suitability for this work is clearly demonstrated by means of numerous illustrations showing the loaders in operation. Specifications are given for several types and a few testimonials and partial list of users are also included.

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers. We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time. We can finish steel stampings in Nickel, Brass or Copper. Send us a sample order.

BOOK REVIEWS.

Engineering Workshop Exercises, by Ernest Pull, A.M.I.M.E., 78 pages, 7¼ x 4¾, 37 drawings and illustrations, published by Whittaker & Co., London England; price 50 cents, net. This is a handy little book arranged in the form of a series of lessons or exercises on engineering workshop practice. The lessons are designed to meet the requirements of students in technical schools, and embrace general fitting and machine work. The book will be equally useful for apprentices, as the exercises cover the problems which confront the young mechanic in the shop. The subjects dealt with are all of a practical nature and include chipping and filing, drilling, scraping, forging, turning, etc., while several exercises are devoted to explaining how to make calipers, squares, chisels, etc. Other exercises deal with screw threads and gauges. A chapter is devoted to screw cutting and notes on materials, while the concluding pages contain some useful tables on alloys, specific gravity, melting point and physical properties of metals, etc. This book should be of great assistance to the student and apprentice in helping him to learn the correct method of using tools to obtain the proper degree of accuracy in his work.

Practical Iron Founding, by Joseph G. Horner, A.M.I.M.E., 404 pages, 7½ x 4¾, 283 illustrations, published by Whittaker & Co., London, England; price $1.25 net. This is the fourth edition of the work revised and enlarged, parts having been re-written on account of the great changes that have taken place in foundry practice in recent years. The author has frequently contributed to our columns, therefore readers of Canadian Machinery will appreciate the value of the information contained in this volume. Needless to say, the book is written from a thoroughly practical viewpoint, and is intended for the use of both the student and the molder. The book is arranged in such a manner that any person acquainted with the principles of molding and foundry operation should have no difficulty in following the text. It contains sixteen chapters covering 347 pages, the remaining pages comprising an appendix. Chapters one to seven deal with sands, varieties of iron, cupolas, shops and equipment, molding boxes, etc., while the following chapters deal more with actual molding and cover such subjects as green and dry sand molding, cores, loam work, machine molding, examples of molding machines, machine molded gears, miscellaneous economies, etc. The appendix contains 15 tables, giving a great deal of useful information on sand mixtures, ropes, chains, fans, blowers, weights of various metals, etc. The illustrations are numerous, well arranged and distinct.

Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.00

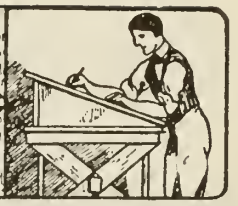
FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price $1.00

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels —annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.50



Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

THE CAMEL HAIR BELTING

As a Power Transmitter is Cheapest—Why?

BECAUSE! It lasts longer than any other belt on the market.
BECAUSE! It slips just one-half that of any other belting.
BECAUSE! It will run equally well in damp, wet or a dry atmosphere.
BECAUSE! It is less affected by acid fumes and high temperatures than any other Belting.
BECAUSE! It is uniform in thickness and runs true.
BECAUSE! Of its great strength—almost twice that of best oak-tanned double leather.
BECAUSE! It requires much less attention than other styles of belting.
BECAUSE! The stretch comes out quickly and after taking up once or twice (according to load and nature of run) requires little or no more attention.
BECAUSE! It transmits more power than any other belting.

INGERSOLL-RAND
AIR HOISTS

ARE SWIFT AND SURE

The straight-lift air hoist is the cheapest and most direct means of making the short, quick lifts so numerous about a shop.
The cost is nominal — one ton being lifted 5 feet 28 times for one cent.
Built in capacities from ½ to 15 tons, with lifts of any practicable length.

ELECTRIC BENCH GRINDER

You will find it the handiest tool in your Shop!

We are now prepared to supply them as follows:

No. 1, 1/6 H.P., A.C., capacity two 6 x ¾ in. Emery Wheels.
No. 2, ¼ H.P., A.C., capacity two 6 x 1 in. Emery Wheels.
No. 2, ¼ H.P., D.C., capacity two 6 x 1 in. Emery Wheels.
No. 3, ½ H.P., D.C., capacity two 8 x 1 in. Emery Wheels.
No. 4 1 H.P., D.C., capacity two 10 x 1 in. Emery Wheels.

STOW MFG. CO.
BINGHAMTON, N.Y., U.S.A.

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

ELECTRICAL MACHINERY for all Purposes.
ELLIOTT BROS'. { INSTRUMENTS / RECORDING GAUGES

PIPE VENTILATED A C MOTOR
FOR VERY DIRTY PLACES

A WELD MADE WITH

LAFFITTE

WELDING PLATES

WILL

¶ Last as long as the steel—and be absolutely homogeneous.
¶ Be accomplished in one-third the time, and save at least 30% in fuel and labor, with no waste, as with powder.
¶ Maintain the elongation and increase considerably the tensile strength of the steel.
¶ Never be returned broken in the weld.
¶ Mean more business for you.

"SEND FOR A FREE SAMPLE, TEST IT AND BE CONVINCED."

For sale by dealers throughout Canada.

The Rivett No. 3 Internal Grinder With Water Attachment

This Machine is equipped with the Rivett High-Speed Spindle, running from 10,000 to 25,000 R.P.M., a speed equal to the highest obtained in outside grinding.

Holes ground on the Rivett Grinder are true, there is no bell-mouth.

Let us figure on your work.

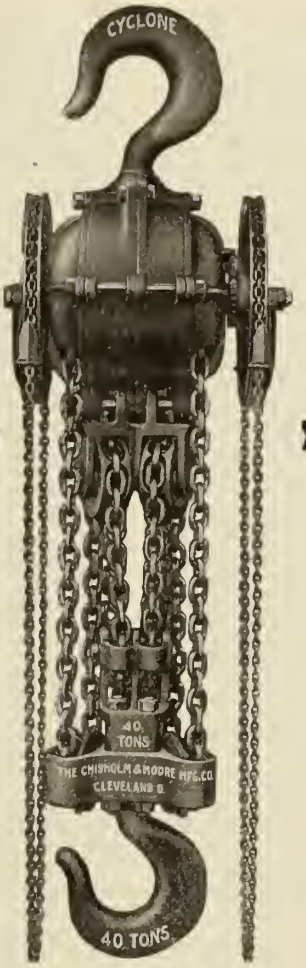
The Whiting Cupola

Standard for Thirty Years

3000 Sold

The figures tell the story

Cranes	Core Ovens	Air Hoists
Cupolas	Cars and Trucks	Elevators
Charging Machines	Turntables	Converters
Tumblers	Industrial Track	O. H. Furnaces
Cinder Mills	Tramrail Systems	Brass Furnaces
Ladles	Trolleys	Malleable Furnaces



Watters Quick-Detachable Grab Buckets

Complete Foundry Plants

WHITING
FOUNDRY EQUIPMENT CO.
HARVEY-ILL. U. S. A.
CHICAGO SUBURB.

Cranes of all Kinds

Capacity **40 Tons**

"CYCLONE"

High-Speed Chain Hoist

Light in weight, compact.

Highest gear with light hand pull.

Self-lubricating, graphite-bronze bushings.

Easy-working and efficient brake.

Eccentric gyrating gears give speed reduction with minimum friction.

Every hoist and every part of it carries the maker's GUARANTEE.

They are warranted to be right in every respect. If any defect develops, write direct to us. We stand ready to repair or replace.

Nova Scotia Steel and Coal Company, Ltd.

BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

For prices and particulars apply to

Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or Head Office, New Glasgow, Nova Scotia

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

The "No-Wear" Nozzle

An exclusive feature of the
"Sly" and Satisfaction

And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

The W. W. Sly Mfg. Co.

CLEVELAND, OHIO

Complete Sand Blast Rooms and Equipment a Specialty

QUALITY ALUMINUM BRASS

We specialize in Pulp Mill Acid-Resisting Castings of all kinds.
Best equipped foundry in Canada.
Capacity 20.000 lbs.
Can make castings up to 5,000 lbs.

ALUMINUM CASTINGS

SMOOTH-ON

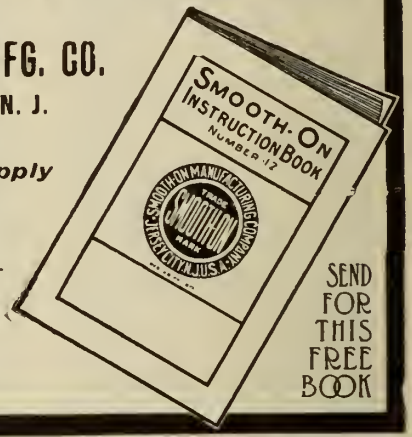
IRON CEMENTS

No. 1, No. 2 and No. 3

Permanently stop all leaks of steam, water, fire or oil, in iron or steel castings, boilers, tanks, piping, pumps, screw thread joints, flanged joints, etc.

Smooth-On No. 4 is unequalled for filling in blow-holes in iron or steel castings.

The Smooth-On Cements are easy to apply and make permanent repairs, proved by years in use.



Every engineer should read our new No. 12 illustrated instruction book—FREE. It tells when, where and how to use the different Smooth-On Cements. Send for it now.

WASHED COTTON WIPERS

The advertiser would like to know where you saw his advertisement—tell him.

No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
How to use Stevens' Stopper, or Circle Cement:
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

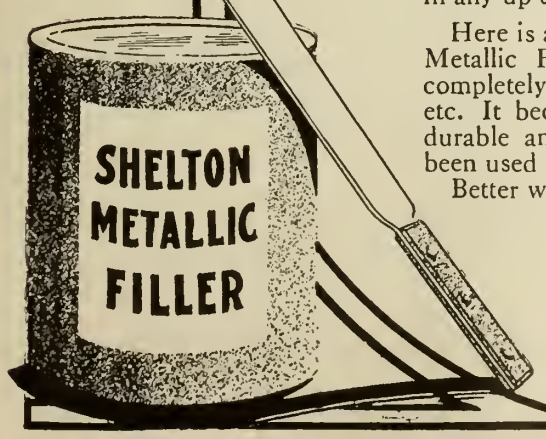
A sign of good profits



FOR YOU--FOR EVERY FOUNDRYMAN

Shelton Metallic Filler

is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years.
Better write to us at once.

Every casting means a profit if you are a user of SHELTON METALLIC FILLER
At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*

SHELTON METALLIC FILLER CO.
DERBY, CONN.

Do You Consider the Life of Your Tools?

When you grind tools with properly selected

Norton Alundum Grinding Wheels

you will obtain a cutting edge that will show the longest life. A wheel that will not burn, check nor "skin soften" the tool must be of a special temper as well as of the correct grain and grade. In producing this special temper, the highest skill in abrasive manufacture is demanded.
